VITAL STATISTICS OF THE UNITED STATES, 1960

VOLUME I—NATALITY

A brief summary of the contents for each section is listed below for the convenience of the reader. A complete table of contents is shown at the beginning of each section and is identified by a narrow black edge which can be located easily by fanning the pages. Each section is paged independently, using the section number as the identifying prefix.

Section 1. Natality—General Summary

Text discussion of national trends and differences between population groups; charts; summary tables containing crude and age-specific rates, fertility rates, percentage distributions, and other statistical measures.

Section 2. Natality—Characteristics

Detailed frequency tabulations for the United States, each State, and each metropolitan area. Data are shown by color, sex, nativity, month, age of mother and of father, birth order, attendant, birth weight, period of gestation, plurality, and legitimacy.

Section 3. Natality—Local Area Statistics

Frequency tabulations for each State, county, and city with a population of 10,000 or more by color and attendant; for urban and rural and metropolitan and nonmetropolitan areas within each State by color, attendant, and birth weight.

Section 4. Natality—Puerto Rico and Virgin Islands

Frequency tabulations by various characteristics, including sex, month of birth, age of mother and of father, birth order, attendant, and birth weight.

Section 5. Technical Appendix

Text discussion of factors affecting the collection, classification, and interpretation of the natality statistics published in this volume. Includes population tables for computing vital rates.

Section 6. Subject Index

Consolidated indexes of the text and statistical tables in this volume.

Section 1. Natality – General Summary

	Page
Changes in this report	1-1
Trend of the crude birth rate	1-2
Age-sex-adjusted birth rate	1-3
Gross and net reproduction rates	1-4
The general fertility rate	1-4
General fertility and live-birth order rates for native white women	1-5
Birth rates by age of mother and live-birth order	1-5
Parity distribution and birth rates by parity and age of mother	1-7
Birth rates by age of father	1-8
Births by sex of child	1-8
Birth rates by specified race	1-9
Birth rates by month	1-10
Plural births	1-11
Attendant at birth	1-11
Illegitimate births	1-12
Birth weight	1-13
Birth rates by State	1-14
Birth rates by age of mother and State	1-14
Birth rates and fertility rates by standard metropolitan statistical areas	1-15

1-AD. Live births, birth rates, and fertility rates, by color, for standard metropolitan statistical areas of the United States: 1960 ---- 1-39

SECTION 1. NATALITY - GENERAL SUMMARY

In 1960 there were 4,257,850 live births registered in the United States, about the same number (4,244,796) as in 1959. The crude birth rate was 23.7 per 1,000 population, a modest decline from the rate of 24.0 in the previous year (table 1-A). The usefulness of the crude rate as a measure of comparative fertility is limited by the fact that it is affected by the age and sex distribution of the population. It is of interest, however, as a component of the rate of natural increase—the birth rate less the death rate. In 1960 the rate of natural increase in the United States was 14.2 persons per 1,000 population.

Crude birth rates and rates of natural increase for other countries in 1960 were as follows: [1]

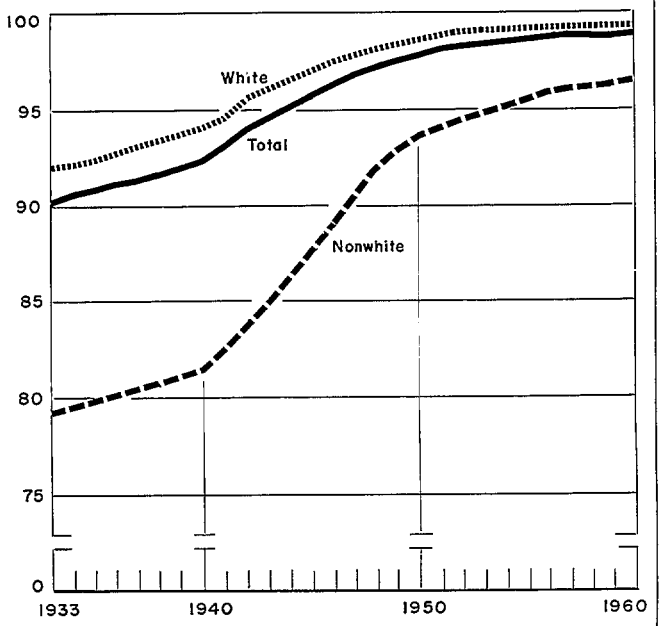
	Crude birth rate	*Rate of natural increase*
France	18.0	6.6
Italy	18.5	8.8
Spain	21.9	13.2
Sweden	13.7	3.7
United Kingdom	17.5	6.0
Japan	17.2	9.6

The highest rate of natural increase in the United States since the completion of the birth- and death-registration areas was 16.5 in 1947. During the midthirties the rate was as low as 6.8.

FIGURE 1-1

PERCENT COMPLETENESS OF BIRTH REGISTRATION, BY COLOR: UNITED STATES, 1933-60

(Data for 1940 and 1950 are based on results of nationwide tests of registration completeness. Data for other years are estimated)



Changes in this report

Several differences in content between this report and those for preceding years warrant mention.

Hawaii officially became a State of the United States on August 21, 1959. Therefore, statistics for Hawaii are included with those for other States in 1960. Since the population of Hawaii comprises only 0.4 percent of the total United States population, the comparability of most vital statistics for the United States is not significantly affected. However, the atypical racial composition of the population of Hawaii (and of Alaska) does affect significantly the number of births for certain numerically minor groups, particularly the "other race" group (see page 1-9). For the statistics shown by individual States exactly comparable United States figures can be obtained by subtracting the Hawaii data for 1960 from the United States totals, or where corresponding data have been published by adding Hawaii data for 1959 and Alaska and Hawaii data for earlier years to the United States totals for the corresponding years.

Several new tables are shown in 1960. Particular attention is called to tables 2-16 to 2-19 in Section 2 and table 1-AD in Section 1, which show birth data for the individual standard metropolitan statistical areas and the metropolitan and nonmetropolitan parts of each State.

[1] Rate of natural increase is the birth rate minus the death rate. Figures are based on data published in *Monthly Bulletin of Statistics*, Statistical Office of the United Nations, New York City, New York, November 1961.

The rate tables give data for varying periods—some only for recent years and others back to the earliest year for which data are available. In many cases corresponding rates for earlier years will be found in preceding issues of Volume I of *Vital Statistics of the United States*.

Adjustment for underregistration of births was discontinued in 1960. A discussion of the reasons is presented in the Technical Appendix. In time-trend tables, which have been shown on an adjusted basis in previous reports, adjusted data are given through 1959 and registered data for 1959 and 1960. Data adjusted for underregistration are so indicated in the tables; otherwise, the tables include only registered births.

Text comparisons of 1959 and 1960 figures are made on the basis of registered births. For the total United States population, registration is estimated to be close to 99 percent in 1960 (figure 1-1 and table 1-P). Thus the comparability of 1960 figures with adjusted data for earlier years is not affected significantly. The discrepancy for the white group is less than for the total population, but it is over 3 percent for the nonwhite. To provide the necessary linkage between data for 1960 and earlier years, figures are shown for 1959 on both a registered and an adjusted basis.

Trend of the crude birth rate

Estimates of the total number of births and the birth rate in the United States have been made for each year since 1909. As shown in table 1-B and figure 1-2, the mid-thirties separate two contrasting periods of change in the crude rate. In the earlier period, 1909-33, the rate underwent a marked decline, dropping from 30.0 to 18.4. This represents a continuation of the downward trend that had started many years before. Available estimates place the annual rate in the colonial period at 50 to 57 births per 1,000 inhabitants.[2] The only appreciable interruption occurred shortly after the First World War. Following a sharp drop in 1919, the rate climbed in the next 2 years again turning downward to reach an all time low during the depression period. The long-term decline has been characterized as a genuine demographic revolution, related to the development of modern society, the rapid development in arts and sciences, and the adoption of a rational approach in individual and family living.[3] Changes in the reproductive patterns of persons living in both urban and rural environments, and the increasing and more widespread knowledge of effective contraceptive methods are factors associated with this secular trend. The movement toward urbanization was also

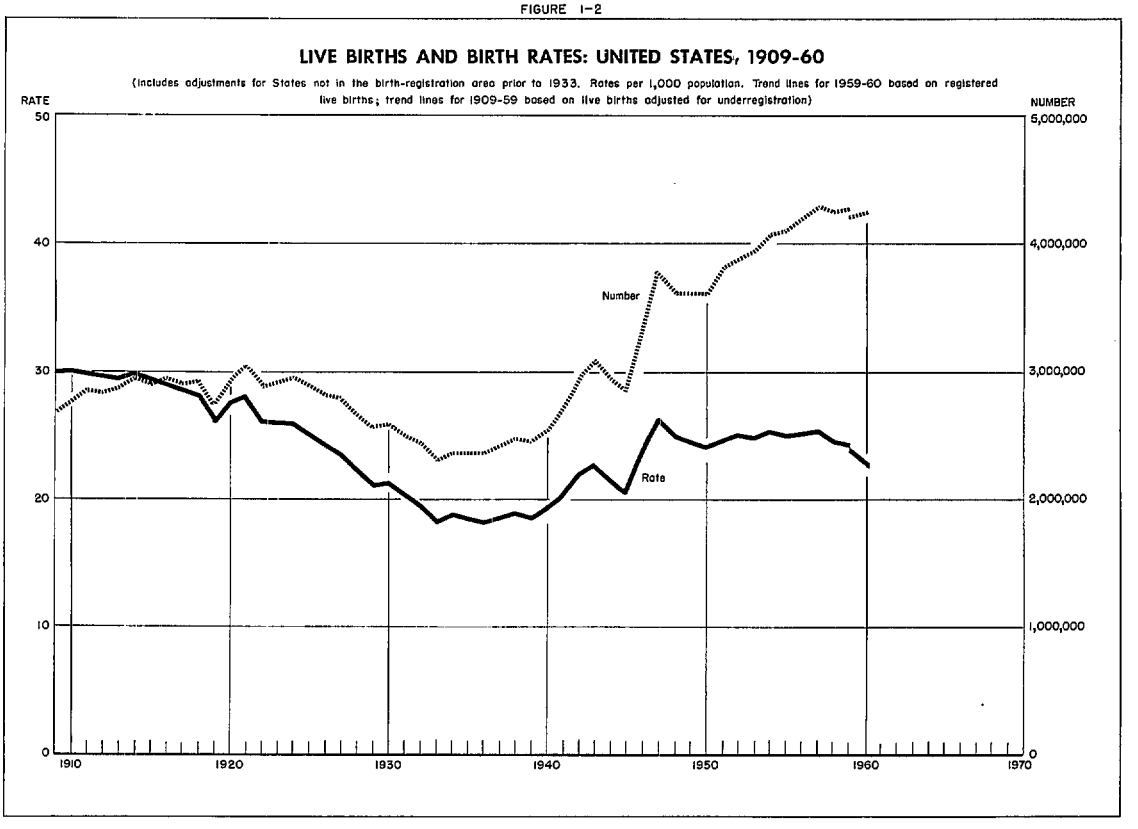
FIGURE 1-2



a factor, since fertility is normally lower in urban than in rural areas. However, its contribution is regarded as minor by some demographers. The postponement of marriage and childbearing during the depression of the 1930's was an additional factor in lowering the birth rate.

In the years since the midthirties the rate has recovered much of the loss that occurred in the two preceding decades. Initially, there was a slow, irregular, upward movement through 1940. This was succeeded by a more rapid rise during the early years of World War II, and by 1943 the rate was at its wartime peak (22.7). Although some decreases occurred during the latter years of the war (in part due to the absence of large numbers of young men from the country for prolonged periods of time), the rate did not drop substantially. With the end of the Second World War the rate rose sharply until 1947, when it reached what is perhaps the highest point in 25 years. This peak reflects the demobilization of the Armed Forces at the end of 1945 and early 1946, the record number of marriages that followed, and the high levels of employment and income. The decrease in the following 3 years was moderate. In 1951 the rate again moved upward for a few years, and then leveled off at about 25 per 1,000 population. Since 1958 the rate has been declining gradually.

No attempt is made here to predict the future course of the crude rate in this country. It can be hypothesized, however, that if the age specific birth rates observed in 1960 were to prevail in 1965 and 1970, the crude rates in these years would be 23.9 and 25.4, respectively. These calculations are based on the Series II projections of the female population 15-44 years of age published by the Bureau of the Census.[4] If this rise in the rate over the present level occurs, it would be attributable to the more favorable distribution of the population with respect to fertility that could be anticipated during the latter part of the present decade.

Age-sex-adjusted birth rate

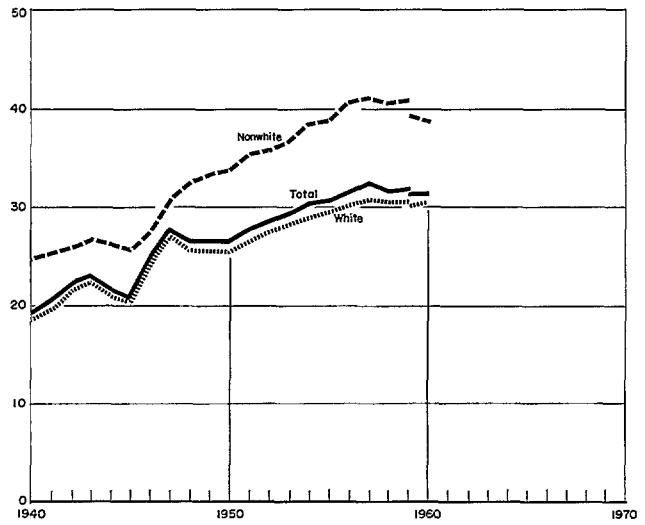
The standardized birth rates in table 1-C and figure 1-3 show what the birth rates per 1,000 population would be in a specified year if there were the same age and sex distributions as in 1940. The rates were computed by the direct method, that is, by multiplying the age-specific birth rates for females 10-49 years of age in the specified year by the number of females in the corresponding age group of the 1940 population. The sum of these products divided by the total enumerated population of 1940 is the age-sex adjusted rate. The identical standardized population is used for both the white and nonwhite groups, that is, the rates are not standardized for color.

The main value of the standardized rate is that it may be compared over a period of years with the knowledge that the observed differences are not attributed to or obscured

FIGURE 1-3

AGE-SEX-ADJUSTED BIRTH RATES BY COLOR: UNITED STATES, 1940-60

(Rates per 1,000 population. Trend lines for 1959-60 based on registered live births; trend lines for 1940-59 based on live births adjusted for underregistration)



by variations in the age and sex composition of the population. Factors such as the low birth rates of the 1930's, the large number of births since World War II, wartime casualties, changes in the age-specific mortality rates and net immigration have contributed to changes in the age and sex distribution. Females in the reproductive ages, for example, are a smaller proportion of the population today than 20 years ago—20 percent compared with 24. While the total population of the United States has increased 36 percent between 1940 and 1960, the number of females in the childbearing ages 15-44 years has increased only 13 percent. Moreover, the increase in the female population of reproductive age was due primarily to gains in the groups 30 years and over. Women in the most fertile age group, 20-24 years, actually decreased by 6.2 percent since 1940; also at ages 25-29, there was a decrease of 1.9 percent.

The standardized birth rate for all races combined shows that had the age-sex distribution of the population remained constant, the birth rate would have risen from 19.4 per 1,000 population in 1940 to 31.2 in 1960. This would have meant an increase of 61 percent over this period compared with an actual increase in the crude rate of 22 percent from 1940 to 1960. The shift from adjusted to registered birth rates in 1960 has little effect on this comparison. If anything, the difference would have been even greater had the 1960 rates also been adjusted for underregistration.

The use of a single standard population for computing rates for the white and nonwhite groups permits the observation of differences in hypothetical crude rates between the two groups if the population distributions of each had been the same. The resultant analysis, however, is not independent of the particular standardizing population used. It would be of interest to explore empirically the effect of alternative standardizing populations on the differences in rates between the two color groups and over a period of time.

Gross and net reproduction rates

A measure frequently used to summarize fertility conditions is the gross reproduction rate. This rate represents the number of daughters a hypothetical cohort of 1,000 women entering the childbearing period together would have during their lives if (a) they were subject to a given set of age-specific birth rates, and (b) none of the cohort were to die before the completion of the childbearing period.[5] Thus a cohort of 1,000 women would bear 1,783 daughters in their lifetime if they experienced the age specific birth rates for 1960 and no deaths occurred before the end of the reproductive-age span. Table 1-D shows that the gross reproduction rate increased steadily between 1950 and 1957, declined in 1958, and leveled off in the last 2 years. The rate for nonwhite women has been consistently much higher than that for white women, and in 1960 exceeded the latter rate by 30.3 percent. In 1940 the difference was 31.4 percent and in 1950 it was 34.2 percent.

The net reproduction rate is based on the specific fertility and mortality conditions observed in a specified year. A rate of 1,000 means that with the age-specific birth and death rates experienced in the specified year, a cohort of 1,000 newly born girls would bear just enough daughters to replace themselves.[6]

It will be noted that in each year the difference between the gross reproduction rates for white and nonwhite women is greater than the difference between the net reproduction rates. This is due to the higher age-specific mortality rates for nonwhite women.

The net reproduction rate, useful as it is in describing fertility and mortality conditions, is of limited value as an indicator of future population growth. It does not take into account such factors as nuptiality, marital duration, parity, and child spacing. Where significant short-term changes in these variables occur, fluctuations in the reproduction rates can be deceptively large.[7]

The general fertility rate

A useful measure of fertility is the rate representing the total number of live births per 1,000 female population aged 15-44 years. In 1960 this rate, computed on the basis of registered live births, was 118.0, virtually the same as the corresponding figure (118.8) for 1959. By comparison, the 1950 rate was 106.2, and during the 1930's it was as low as 75.8 (table 1-B and figure 1-4). Since 1936 there has

[5]The gross reproduction rate may also be defined as the sum of the age-specific birth rates for female infants per 1,000 women of each single year of age. In computing the gross reproduction rates for this report, the age-specific rates for the 5-year age groups have been multiplied by 5, summed, and the total multiplied by the proportion which female births formed of all births.

[6]To obtain the net reproduction rate, the birth rate for each specified 5-year age group was multiplied by 5 and by the probability (as determined from the life table for the year) of women surviving to that age group. The sum of those products was then multiplied by the proportion of births that were female.

[7]Ansley J. Coale and C. Y. Tye, "The Significance of Age-Patterns of Fertility in High Fertility Populations," *The Milbank Memorial Fund Quarterly*, October 1961.

FIGURE 1-4

FERTILITY RATES: UNITED STATES, 1909-60

(Rates per 1,000 female population aged 15-44 years. Trend line for 1959-60 based on registered live births; trend line for 1909-59 based on live births adjusted for underregistration)

been a definite upward movement in the fertility rate despite irregular fluctuations during World War II and the immediate postwar years. The average rate for the past decade was 116.4 compared with 95.3 for 1940-49, and 79.7 for 1930-39.

General fertility and live-birth order rates for native white women

Fertility rates for native white women in the United States from 1920 to 1959 are given in table 1-K and figure 1-5. By limiting this series of rates to the native white group, it is possible to study changes without the effect of the varying fertility patterns of the many foreign-born women who came to this country in the early part of the present century. Declines are observed in the rates for all birth orders for native white women during the 1920's and early 1930's. Rates for first and second births began to recover shortly after 1933; third births did not do so until 1940, and fourth births not until 1943. The rates for fifth and sixth births remained virtually constant during the war and immediate postwar period, but have been rising since the early 1950's. The downward movement of the rate for seventh births was not halted until 1953, while for eighth births and above some recovery was observed by the mid-fifties. The measurement of these rates only to the unit position, however, does not permit a precise indication of the relative change.

Birth rates by age of mother and live-birth order

Rates by age of mother.—Age specific rates relate (a) the number of births to mothers in a 5-year age group to (b) the female population of the same age. A comparison of 1960 rates with those of 1959 shows relatively small differences. At ages 20-24 years there was a slight increase of 1.7 percent, while at ages 30-34 and 35-39 there were decreases of 1.8 and 2.3 percent, respectively. For the other 5-year age groups, the changes were negligible.

In relation to the rates at the start of the decade, the current figures continue to provide a marked contrast (table 1-E and figure 1-6). At ages 20-24 years, for example, there was an increase of 31 percent, and at ages 25-29, an increase of 19 percent:

	1960	*1950*	*Percent increase*
15-44 years	118.0	106.2	11.1
15-19 years	89.1	81.6	9.2
20-24 years	258.1	196.6	31.3
25-29 years	197.4	166.1	18.8
30-34 years	112.7	103.7	8.7
35-39 years	56.2	52.9	6.2
40-44 years	15.5	15.1	2.6

FIGURE 1-5

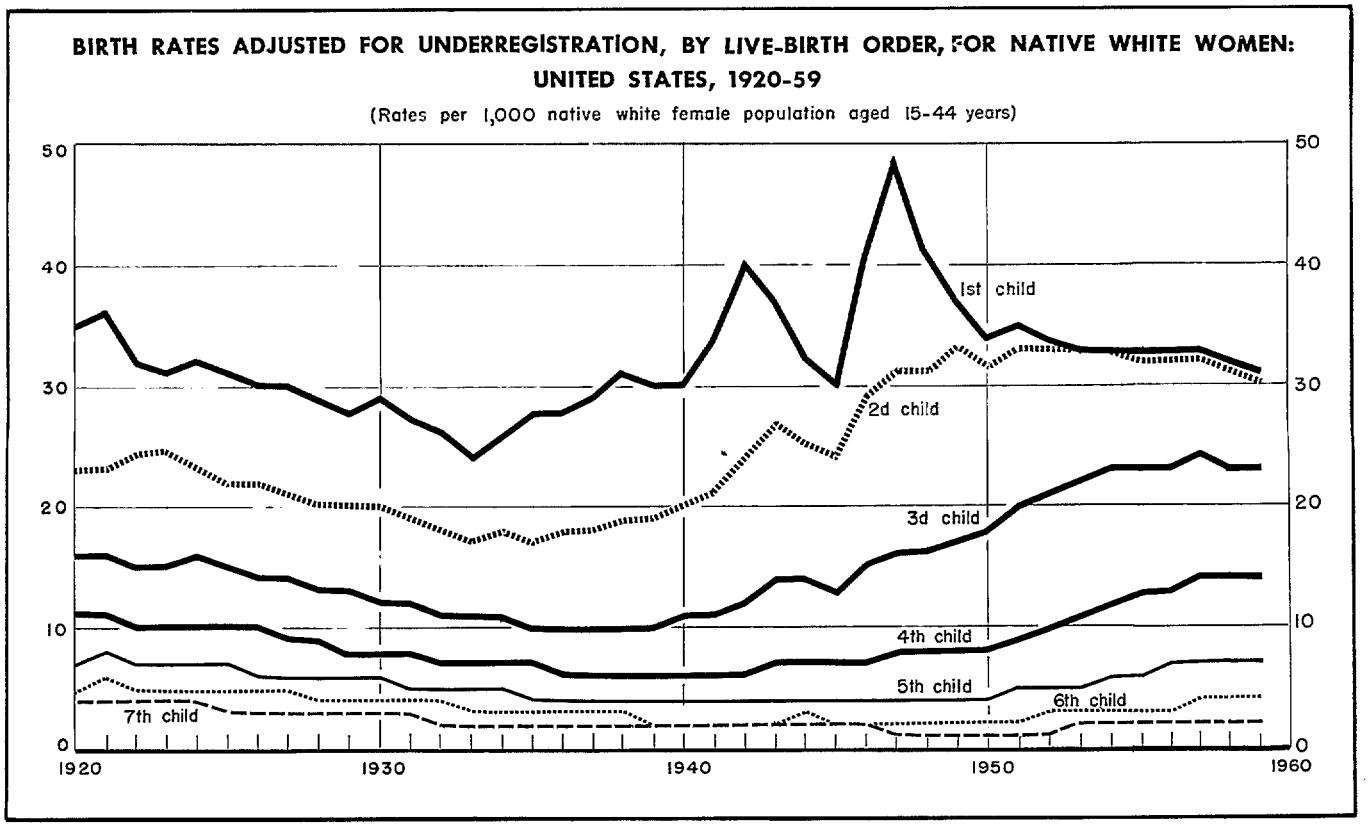

FIGURE 1-6

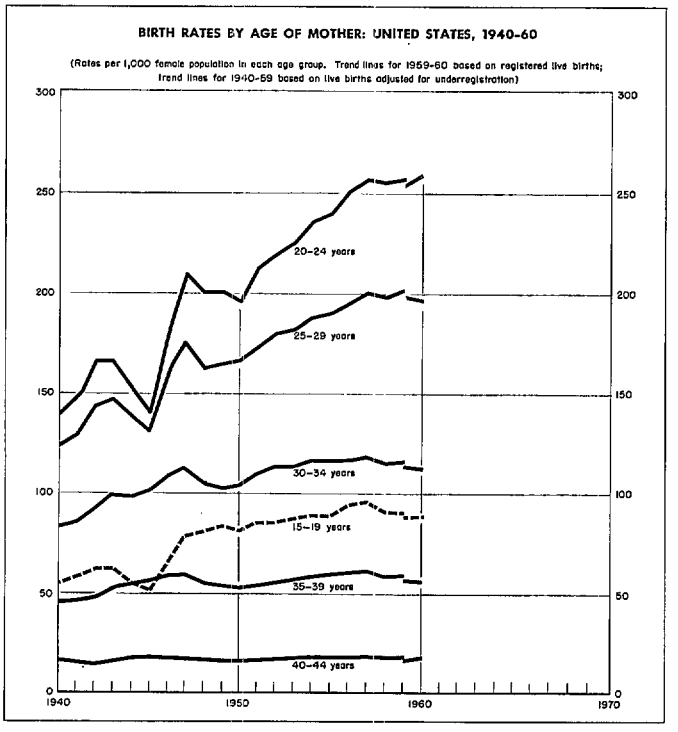


These changes are a function of two factors: (a) the proportion of women who were married, and (b) the marital fertility rates. Between 1950 and 1960, there was a definite rise in age-specific rates for married women (table 1-H). There were also moderate increases in the proportion of married women in the reproductive ages 20 years and over.[8] The percent married in 1950 and 1960 are shown below:

	March 1960	*March 1950*
14-17 years	4.5	5.9
18 and 19 years	28.1	31.6
20-24 years	69.2	66.2
25-34 years	88.1	85.5
35-44 years	87.4	83.7

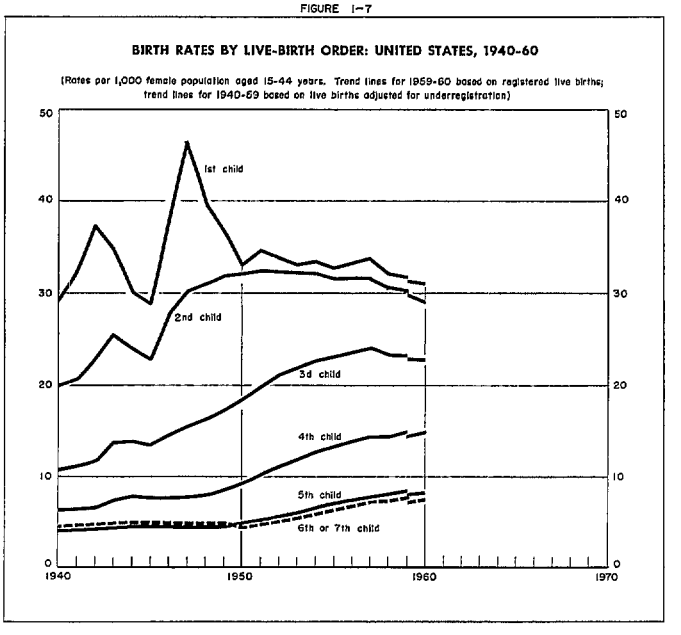
Among all women (married and unmarried combined), the most fertile ages in 1960, as in previous years, were 20-24 years. Over one out of four women in these ages bore a child in 1960. For women aged 25-29 years, the second most fertile group, about one out of five gave birth during this year. Ranking third and fourth were women 30-34 and 15-19 years, respectively. The lower rank order of this latter group is heavily influenced, of course, by the relatively smaller proportion married. Actually, the fertility of married women is far greater at ages 15-19 than at any other age; in 1960, 54 percent of these women bore a child compared with 35 percent at ages 20-24 and 22 percent at ages 25-29 years. This percentage continues to decrease rapidly with age. In 1960, as in other recent years, slightly more than 7 out of 10 babies were born to mothers under 30 years of age and approximately 9 out of every 10 mothers under 35 years. As shown in table 1-G, the median age of childbearing in 1960 was 25.5 years.

Number of births and rates by live-birth order.—Small decreases in the number of first, second, and third births occurred between 1959 and 1960. These were more than offset, however, by increases in the number of fourth and subsequent births. Over the years there has been a gradual shift in the composition of births by birth order. Only 51 percent of all births were first and second children in 1960 compared with 62 percent in 1950. Births of fourth and higher orders now represent 30 percent of the total compared with only 21 percent a decade ago.

Birth rates by live-birth order, per 1,000 female population aged 15-44 years, are given in table 1-F and figure 1-7 for each year from 1940 through 1960. These figures show that the rates for third and subsequent births were substantially greater in 1960 than in 1950, while those for first and second births dropped a little. Percent changes in birth rates by live-birth order for selected years are as follows:

	1950 to 1960	*1959 to 1960*
First child	-6.6	-1.3
Second child	-9.0	-2.3
Third child	+23.9	-0.9
Fourth child	+58.7	+0.7
Fifth child	+72.9	+1.2
Sixth and seventh child	+61.7	+2.7
Eighth child and over	+19.4	+2.4

FIGURE 1-7



[8] U.S. Bureau of the Census, "Marital Status and Family Status: March 1960," *Current Population Reports*, Series P-20, Nos. 96 and 105, November 1959 and 1960.

A comparison of birth-order rates for white and nonwhite groups shows that in 1960 nonwhite rates for all birth orders were below the rates for 1959; in contrast, rates for the white group generally show small increases for birth orders of fourth and higher. Since 1953 the rate for first births among the nonwhites has been slightly above the rate for the whites; in earlier years, the reverse was generally true. This is of interest in view of the findings that the rate of childlessness among nonwhites has in the past been greater than among whites,[9] and suggests the possibility that the latter relationship may be in the process of change.

The base populations used in computing the foregoing rates for birth order include all females 15-44 years of age. Thus, they are not specific as to age and parity, and include segments of the female population in which the probability of having a child of specified order is very low, or is zero. For example, in computing rates for first births in a given year, the population base includes females regardless of their marital status or the number of children they already had. At least part of the variation in the rates for birth order in recent years is, therefore, attributable to changes in composition of the female population by parity as well as age.

Rates by age of mother and live-birth order.—Table 1-J shows birth rates for 1960 by age of mother and live-birth order. These data may be compared with corresponding figures for earlier years to assess the effect of changing age composition of the female population on the rates for specified birth orders. For example, the rate for first births, taking all age groups together, was lower in 1960 than in 1950, but the rates for first births among women aged 15-19 and 20-24 years increased:

AGE	1960	1950	Percent change
FIRST BIRTH ORDER			
15-44 years	31.1	33.3	-6.6
15-19 years	61.4	57.7	+6.4
20-24 years	87.9	80.2	+9.6
25-29 years	26.6	37.1	-28.3
30-34 years	8.6	14.5	-40.7
35-39 years	3.2	5.7	-43.9
40-44 years	0.8	1.2	-33.3
SECOND BIRTH ORDER			
15-44 years	29.2	32.1	-9.0
15-19 years	21.6	19.2	+12.5
20-24 years	87.9	69.4	+26.7
25-29 years	48.8	57.3	-14.8
30-34 years	17.5	27.6	-36.6
35-39 years	6.3	9.6	-34.4
40-44 years	1.3	1.8	-27.8

[9] Wilson H. Grabill and Paul C. Glick, "Demographic and Social Aspects of Childlessness: Census Data," *Milbank Memorial Fund Quarterly*, January 1959.

The situation is similar with respect to the rate for second births. While for all age groups combined, it was 9.0 percent lower in 1960 than in 1950, the rates for second births among women 15-19 and 20-24 years showed increases of 12.5 and 26.7, respectively. Here, also, it was only in the older age groups that a decline occurred. With regard to rates for third and higher birth orders, the increases which occurred between 1950 and 1960 reflected gains in virtually all 5-year age groups.

At all ages, lower birth orders were more prominent for white than for nonwhite mothers. Data in table 1-H indicate that first, second, and third births accounted for more than half of the births among white women through their early thirties. In the case of white women aged 30-34, for example, first, second, and third births accounted for 49 percent of the total, but only 26 percent for nonwhite women. Toward the end of the fertility cycle, higher birth orders almost completely dominated the nonwhite picture. For women 40-44 years of age, sixth births and above comprised 70 percent of the total births to nonwhite women compared with only 40 percent for white women. The disparity in ages between white and nonwhite mothers is shown in table 1-G. In 1960 the median age of the nonwhite mother is lower for every birth order. For first and second births the difference is 2 years, while for third through seventh births it is 3 years or more. In 1950 these differences were greater for nearly all birth orders. The absolute difference (in years) between the median age of white and nonwhite mothers for 1950 and 1960 is as follows:

	1960	*1950*
Total	0.9	1.9
First	2.1	3.1
Second	1.8	3.3
Third	3.1	3.9
Fourth	3.3	3.7
Fifth	3.3	3.6
Sixth and seventh	3.1	3.1
Eighth and over	2.0	1.8

Parity distribution and birth rates by parity and age of mother

The changes in birth-order rates observed in recent years are related to changes in the relative size of the parity group in which such births can occur (table 1-M), and in the size of the parity rate or birth probability, as it is also called (table 1-N). "Parity" refers to the number of live children borne by a woman as of a particular time. Two-parity women, for example, are those who at the beginning of the specified year already have two children, and who may therefore have a third during the year. Thus a factor in the number of third births during any year is the number of two-parity women at the beginning of the year. The parity rate is the proportion of such women who have a third child.

The table in the first column on this page shows that the rate for second births to women aged 25-29 years

declined from 57.3 in 1950 to 48.8 in 1960. It can now be seen that this was not due to a diminished propensity for women with one child to add a second, but rather to a decrease in the relative number of women subject to having a second child. Table 1-N shows that for this age group the birth probability for having a second child actually increased from 144.0 to 181.0 per 1,000 between 1950 and 1960. And table 1-M shows that the percent of one-parity women aged 25-29, as of the beginning of the year, decreased from 29.4 in 1950 to 18.8 as of January 1, 1961.

The parity data also throw light on other aspects of the fertility picture. According to figures for 1960 and earlier years, the chances that a woman with three children will have another baby are greater, on the average, than for a woman with two children. Furthermore, this probability continues to increase (up to a point) with each successive birth. Take, for example, again, women aged 25-29. Table 1-N shows that among those with two children at the beginning of 1960, 181 per 1,000 gave birth to a third during the year. For those with three children, the rate was 184; for those with four children, 208; and so on. For women with seven children or more, over one in three had an additional child in 1960.

A departure from the general pattern of increased rates with increased parity occurs between second and third births. The proportion of women with one child who give birth to a second is consistently greater year after year than the proportion with two children who have a third.

The percentage distribution of women by parity shown in table 1-M provides some insight into the change in family size over the last decade. Among women 30-34 years of age, a steady decline has occurred in the relative number of women who have only one child, while the proportion with three children or more has increased from 28.0 percent in 1950 to 46.8 as of January 1, 1961. There has also been a decline in the percent of women who are childless in all age groups:

	January 1961	*January 1950*	*Percent decrease*
15-44 years	33.6	40.4	16.8
15-19 years	92.3	92.9	0.6
20-24 years	46.3	55.7	16.9
25-29 years	17.9	28.4	37.0
30-34 years	13.7	22.0	37.7
35-39 years	11.9	22.4	46.9
40-44 years	14.1	22.6	37.6

In recent years, among women aged 40-44 years, that is, those reaching the end of their reproductive span, there has been a rapid decline in the number who are childless—from 20 percent in 1956 to 14 percent in 1961. At ages 35-39 years it is already down to 12 percent.

Birth rates by age of father

As would be expected, the highest rates occur at a somewhat older age for men (25-29 years) than for women (20-24 years). The median age of father was 28.8 in 1960 compared with 25.5 for mothers. There has been a small drop in this measure over the past two decades; the median age was 29.8 in 1940 and 29.3 in 1950.

A comparison of the age-specific rates between 1959 and 1960 (table 1-L) shows that the rates for men under 30 increased; rates for all other age groups declined. In recent years, the 20-24 year group showed the greatest rise in rates and between 1959 and 1960 alone it increased 3.5 percent.

Between 1950 and 1960 the rates moved up for each group through age 39. The amount of increase was largest in the younger age groups:

	1950	*1960*	*Percent change*
15-54 years	87.0	94.8	+9.0
15-19 years	14.2	21.5	+51.4
20-24 years	142.0	202.2	+42.4
25-29 years	186.7	232.6	+24.6
30-34 years	141.9	154.2	+8.7
35-39 years	87.2	87.4	+0.2
40-44 years	45.1	42.6	-5.5
45-49 years	19.6	16.7	-14.8
50-54 years	7.5	6.2	-17.3
55 years and over	1.4	1.0	-28.6

Marked changes in the fertility pattern by age of father and color have occurred between 1940 and 1960. In 1940, nonwhite males 20-24 years of age had a higher fertility rate than those 25-29 years old; in 1950 the rates for the two groups were almost equal; by 1955 the older group surpassed the younger group on this measure; in 1959, males aged 25-29 years had an even larger margin over the 20-24 year group; however, in 1960, the rate for the younger group was 2.3 percent higher than for men at ages 25-29 years. Among white males, those aged 25-29 years have been the most fertile group for each year data are available, but a change has occurred in the age group ranking second. In 1940 this position was held by the 30-34 year olds, whose rate was 37 percent higher than the 20-24 year group ranking third. In 1960 the position of the two were reversed, with a difference of 28 percent in favor of the younger group.

Births by sex of child

In 1960, as in previous years, male births outnumbered female births. Table 1-O indicates, however, that there has been a slight decline in the sex ratio since the end of World War II. Currently the ratio is 1,049 males, per 1,000 females, compared with 1,058 in 1946. The white group, rather than the nonwhite, appears to be responsible for this trend. Among the latter group, the ratio fluctuated somewhat erratically between 1,011 and 1,028. In the case of white births, it decreased almost steadily from 1,063 to 1,055.

Various investigations have been carried out as to the factors affecting the sex ratio.[10] In particular, the effect of

Robert J. Myers, "The Effect of Age of Mother and Birth Order on Sex Ratio at Birth," *Milbank Memorial Fund Quarterly*, July 1954.

age of mother, age of father, and birth order have been studied. The following table based on 1960 data presents sex ratios, crossclassified with age of mother and birth order.

COLOR AND AGE OF MOTHER	Total	LIVE-BIRTH ORDER					
		1st	2d	3d	4th	5th	6th and over
TOTAL, ALL AGES-	1,049	1,058	1,049	1,048	1,047	1,039	1,033
15-19 years---------	1,056	1,057	1,051	1,062	1,035	1,054	1,182
20-24 years---------	1,052	1,062	1,046	1,047	1,048	1,019	1,050
25-29 years---------	1,048	1,058	1,054	1,052	1,050	1,032	1,024
30-34 years---------	1,047	1,044	1,056	1,046	1,050	1,045	1,040
35-39 years---------	1,037	1,026	1,032	1,039	1,039	1,062	1,023
40-44 years---------	1,039	995	1,057	1,018	1,039	1,011	1,050
White, all ages---	1,055	1,062	1,053	1,053	1,052	1,049	1,045
15-19 years---------	1,061	1,064	1,056	1,042	1,076	969	2,182
20-24 years---------	1,057	1,063	1,049	1,057	1,055	1,041	1,065
25-29 years---------	1,054	1,064	1,058	1,055	1,055	1,041	1,047
30-34 years---------	1,052	1,045	1,059	1,049	1,054	1,052	1,048
35-39 years---------	1,043	1,032	1,034	1,046	1,036	1,069	1,030
40-44 years---------	1,046	1,016	1,061	1,022	1,036	1,016	1,067
Nonwhite, all ages-	1,018	1,027	1,024	1,017	1,023	1,000	1,010
15-19 years---------	1,037	1,026	1,039	1,094	1,004	1,094	848
20-24 years---------	1,021	1,048	1,020	1,000	1,029	988	1,039
25-29 years---------	1,006	1,000	1,005	1,026	1,016	1,003	993
30-34 years---------	1,021	1,031	1,041	1,016	1,011	1,010	1,024
35-39 years---------	1,002	976	1,008	956	1,055	997	1,003
40-44 years---------	997	829	1,000	995	1,059	973	998

In general, the sex ratio dropped with an increase in (1) birth order or (2) age of mother. However, this relationship does not usually hold true for a crossclassification of any single birth order with any 5-year age of mother group.

Birth rates by specified race

The number of live births and crude birth rates by race for 1940, 1950, and 1960 were as follows:

RACE	1960[1]	1950[2]	1940[2]
NUMBER			
ALL RACES----------	4,257,850	3,631,512	2,558,647
White----------	3,600,744	3,107,638	2,198,911
Nonwhite----------	657,106	523,874	359,736
Negro----------	602,264	497,503	341,577
Indian----------	21,114	15,671	14,022
Chinese----------	5,846	5,139	1,123
Japanese----------	12,992	3,458	1,905
Other races[3]----------	14,890	2,103	1,109
RATE			
ALL RACES----------	23.7	24.1	19.4
White----------	22.7	23.0	18.6
Nonwhite----------	32.1	33.3	26.7
Negro----------	31.9	33.1	26.5
Indian----------	40.3	45.8	42.0
Chinese----------	24.6	43.9	14.5
Japanese----------	28.0	24.5	15.0
Other races[3]----------	37.8	19.1	22.0

[1]Based on a 50-percent sample of births.
[2]Births adjusted for underregistration.
[3]Includes 5,420 births to Hawaiians and Part-Hawaiians and 1,352 births to Aleuts and Eskimos.

Inference based on these data should be made with considerable caution, however. There are a number of problems besetting comparability, both with regard to interracial differences for any year, and trend analysis:

(1) The rates for earlier years were adjusted for underregistration while the 1960 rates are based on registered births. The estimated underregistration varies among the nonwhite races and is largest for the Indian population. Therefore, the decrease in the rates shown for this group between 1950 and 1960 does not necessarily mean a significant decline in fertility. To a lesser degree, the trend in rates for Negroes is similarly affected.

(2) The rates are based on the number of persons in each race enumerated by decennial censuses. However, the census classification of the races has changed somewhat at each census. In the 1960 census, persons were not ordinarily classified by the enumerator, but were classified by the respondents themselves. There are indications, however, that with the exception of Indians, the racial composition of the population in 1960 shows little evidence of change in major categories from the previous census, except as explained by natural increase and immigration. The use of self-enumeration undoubtedly added to the accuracy of the count of Indians, since in past censuses, it was believed there was substantial underenumeration of Indians living off the reservations. There was also an artificial increase in the Indian population between 1950 and 1960 due to the fact that a certain population of mixed white, Negro, and Indian ancestry in the eastern part of the United States, which were classified as "All other" races in 1950, were identified as Indians in the 1960 census.[11]

(3) The rates for the earlier decades refer only to conterminous United States (48 States and the District of Columbia). The inclusion of data on the various races residing in Alaska and Hawaii greatly affected the 1960 data because of heavy concentration of Chinese, Japanese, and Other races in Alaska and Hawaii. Over half of the "Other races," for example, reside in Alaska and Hawaii, resulting in a tremendous increase in the number of births for this group between 1950 and 1960. The following birth rates for 1960 are given below, showing the effect on rates by the addition of data from the two newest States:

	Total United States	*Conterminous United States*	*Hawaii and Alaska*
Chinese---------	24.6	25.8	18.8
Japanese--------	28.0	34.7	19.4
Other races-----	37.8	35.9	39.3

[11]For a more complete discussion on census race classifications, see *U.S. Census of Population: 1960, General Population Characteristics, United States Summary*, Final Report PC(1)-1B, U.S. Bureau of the Census. Washington, U.S. Government Printing Office, 1961, p. xi.

The crude rate has remained at a high level for Indians, has dropped dramatically for Chinese, and has shown a substantial rise for Japanese, especially among those residing in conterminous United States. Although detailed population characteristics are not yet available for non-white races, at least for Japanese, the 1960 census revealed that the females outnumbered the males for the first time, a reflection of the large number of war brides immigrating from Japan during the last decade who were of reproductive age. Similarly, around a decade ago the Chinese birth rate rose phenomenally; the immigration of Chinese war brides and of Chinese females of reproductive age after the relaxation of the 1924 Immigration Act in 1943 helped to raise the birth rate of the Chinese in 1950 to 43.9.[12]

The doubling of the rates for "Other races" between 1950 and 1960, as shown above, is partly due to the fact that the numerically larger number in this group residing in Alaska and Hawaii were not included in the 1950 figures. Among Hawaiians and Part-Hawaiians in Hawaii alone, in 1950 the number of births was almost twice the number of births to "Other races" in conterminous United States; the rate for these residents of Hawaii (43.7) was more than twice that of the latter group. Also, comparability of the 1950 and 1960 rates for "Other races" is affected by a change in the census race classification of the population of mixed white, Negro, and Indian ancestry residing in the eastern part of the United States. In the 1950 census they were classified with "Other races," while the 1960 census classified this group as "Indian." However, in the birth statistics they were classified as "Indians" in 1950 and 1960.

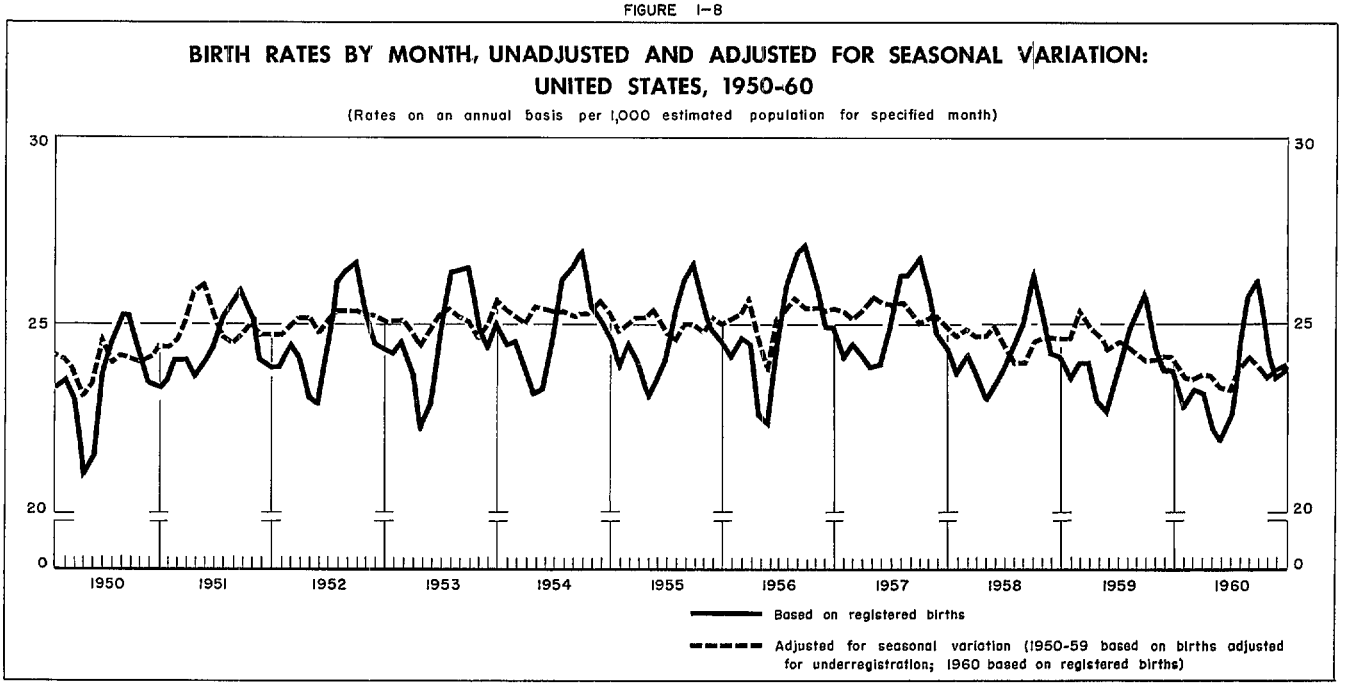
Birth rates by month

Crude birth rates by month (adjusted to an annual basis) in the period 1950 to 1960 followed a fairly regular seasonal pattern (table 1-Q). As shown by the solid line in figure 1-8, there was a minor peak in February of each year, a major peak in August or September, and troughs in the spring and in December-January. This resembles the bimodal distribution observed in the years prior to World War II.[13] However, in the earlier pattern the lowest rate was in December, whereas in the more recent period the annual low was in April or May. Also, monthly fluctuations were previously more moderate.

A comparison of seasonal pattern of births in the United States with that of Japan indicates that the monthly variation in births was much greater for the latter country. In this connection it would be interesting to explore the possible role of cultural and other factors such as differences in seasonal pattern of marriages and practices of legalized abortion and birth control. The number of births for January, the peak month for Japan, in 1957, 1958, and 1959 is 21 percent greater than the number born in March, the second highest month of birth. The monthly fluctuations noted for England and Wales seem comparable with those for the United States. The peak month of birth for England and Wales, however, is March with a minor peak in September. The monthly indices of births for the United States, England

[13]For a detailed discussion of seasonality, see "Seasonal Variations of Births in the United States, 1948-54," by Deward E. Waggoner and Joseph Schachter, National Office of Vital Statistics, *Vital Statistics—Special Reports*, Vol. 47, No. 4, 1959.

FIGURE 1-8



and Wales, and Japan are as follows:[14]

MONTH	UNITED STATES			ENGLAND AND WALES[1]			JAPAN		
	1960	1959	1958	1959	1958	1957	1959	1958	1957
January	95.8	96.9	96.4	101.3	100.1	97.5	129.2	126.2	130.5
February	97.7	99.1	99.2	105.3	102.9	102.9	117.8	113.6	116.6
March	97.0	99.4	97.3	107.7	108.9	105.4	108.5	105.6	106.1
April	93.8	94.9	94.4	105.6	105.1	104.4	109.0	103.9	105.5
May	92.4	93.7	95.9	105.0	104.1	105.5	93.9	91.2	93.1
June	95.3	98.3	97.9	101.4	98.0	102.5	87.0	88.5	89.4
July	103.8	103.7	101.1	100.1	94.0	97.5	91.3	92.9	94.3
August	108.8	105.4	103.0	96.0	95.1	96.4	93.4	92.8	95.2
September	111.0	108.1	109.4	99.0	100.6	100.9	94.6	95.8	92.3
October	102.8	102.1	104.7	95.9	97.5	98.6	91.8	95.6	89.3
November	100.3	99.1	100.3	90.2	95.8	93.2	91.8	97.9	93.4
December	101.4	99.3	100.2	92.8	98.1	95.5	91.6	96.0	94.4

[1]Limited to legitimate live births only. The low ratio in June, July, and August of 1958 is attributed to the epidemic of Asian influenza which occurred in the autumn of 1957.

Table 1-R and figure 1-8 show the monthly crude birth rate adjusted for seasonal variation. The residual movements represent random variation as well as the fertility response to underlying nonseasonal changes in specific factors. Monthly fertility rates adjusted for seasonality are also shown in table 1-R. While in any single year the pattern of these rates would be similar to those of the crude rate, for use in secular trend analysis, the fertility rate series is more appropriate.

Plural births

Of the 4,257,850 live births in 1960, 86,684 or 20.4 per 1,000 were from plural deliveries. This ratio varies somewhat from year to year:

	Total	*White*	*Nonwhite*
1960	20.4	19.3	26.3
1959	20.6	19.5	27.0
1958	20.6	19.5	27.0
1957	20.5	19.4	26.7
1956	21.3	20.4	26.6

Among States it ranged from a low of 16.4 in Hawaii to a high of 23.4 in Mississippi and Arkansas. (It should be noted that the foregoing data are in terms of the number of live births from plural deliveries rather than the number of confinements.) These geographic variations in the ratio are largely due to differences in racial composition. Orientals have the lowest twinning rate, whites next, and Negroes the highest.

For both the white and nonwhite groups, the sex ratio of males to females was higher in single than in plural deliveries:

	Single deliveries	*Plural deliveries*
White	1,055	1,017
Nonwhite	1,019	989

This may be explained by the greater fetal loss among plural births, in combination with the fact that fetal-death rates are highest among males. In the 1958 twin birth data in which the twin live births and fetal deaths were matched by mates, the sex ratios for both white and nonwhite twins were higher—1,025 and 1,033, respectively.

The median weight for births from plural deliveries (2,440 grams) is 880 grams less than for births from single deliveries (table 1-Y). This size difference is due to the generally earlier termination of pregnances involving multiple births and the less favorable nutritional environment of twins during the gestation period.[15]

The relative frequency of multiple births increased with age of mother up to ages 35-39. The chances of twinning are over twice as great at the latter ages than at 15-19. This situation holds true for both the white and nonwhite groups, except that the differences by age among the nonwhite are even greater. Plural births per 1,000 total-live births by age of mother are shown below:

	Total	*White*	*Nonwhite*
15-44 years	20.4	19.3	26.4
15-19 years	12.5	11.9	14.9
20-24 years	16.9	16.0	22.4
25-29 years	21.7	20.4	29.9
30-34 years	26.9	25.3	36.4

Research into the factors associated with twinning has shown that birth order as well as age of mother is a significant variable.[16]

Attendant at birth

In 1960, 97 births out of every 100 were delivered in hospitals compared with 56 percent in 1940. This striking increase is believed to be at least partly responsible for the substantial declines in infant and maternal mortality

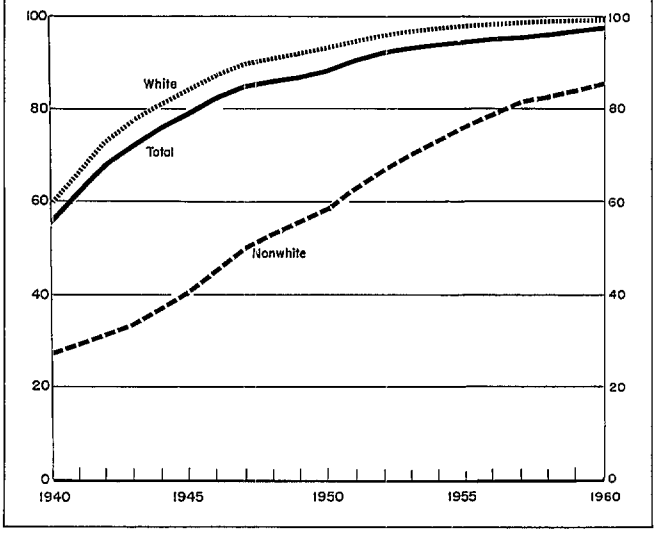
that also took place during these years. The trend in hospital utilization for obstetrical care is characterized by a fairly rapid rise through the midforties and a more gradual increase since (table 1-S and figure 1-9). The in-hospital movement has been accompanied by a marked decrease in the proportion of births delivered by nonphysicians. Only 2.2 percent of births were nonmedically attended in 1960, whereas in 1940 the figure was 9.3 percent.

FIGURE 1-9

PERCENT OF TOTAL REGISTERED LIVE BIRTHS OCCURRING IN HOSPITALS BY COLOR: UNITED STATES, 1940-60



The proportion of white births delivered in hospitals is now close to 100 percent, and this has been accomplished over a relatively short span of years. As recently as 1940 only three out of five white births occurred in hospitals. However, during the war years considerable progress was made and by 1948 the proportion had risen to 90 percent. It has since continued to increase, and in 1960, stood at 99 percent.

With the low rate of hospital utilization prior to 1940 for the nonwhite group, the potential for improvement has been much greater. Between 1940 and 1960 the proportion of in-hospital births to nonwhite mothers tripled—from 27 percent to 85 percent. There were also sharp increases in the proportion of births attended by physicians. Eighty-eight percent of the nonwhite births were medically attended in 1960 as compared with only 51 percent in 1940. For the white group, on the other hand, the proportion of births attended by physicians has been near 100 percent for a number of years.

Table 1-T shows the percentage distribution of live births by attendant and color for geographic areas. The proportion of births delivered by nonphysicians is generally highest in the Southern States. In Mississippi nearly one-fourth of all registered births were delivered without benefit of medical attendance. In Alabama and South Carolina, the corresponding proportions were 15 and 13 percent, respectively.

This is partly due to the fact that the disparity between the color groups in the proportion of medical deliveries is greater in the South than elsewhere. In Mississippi, for example, over 99 percent of white births, but only 56 percent of the nonwhite, were delivered by physicians. Since nonwhite births form a large part of the total in the State, this tends to depress the overall average.

The differences in percent of midwife deliveries of nonwhite infants between 1950 and 1960 are shown for States where the midwifery is still prominent.

	1960	*1950*
Alabama	39.3	50.7
Alaska	17.5	34.9
Arkansas	29.5	54.0
Florida	16.0	44.0
Georgia	26.4	48.9
Mississippi	43.5	60.3
North Carolina	17.5	34.0
South Carolina	30.0	56.6
Texas	10.0	22.4
Virginia	19.3	39.9

Illegitimate births

An estimated 224,330 babies were born out of wedlock in 1960. This number is 1.7 percent greater than in 1959 and more than twice as large as in 1940, the last prewar year. The 1960 figure is the smallest annual increase in a decade.

These figures are for the United States as a whole and are based on information from the live-birth records in those States that require reporting on legitimacy (table 1-V); they include an estimate for the States not reporting this item. There are no adjustments for misstatements concerning legitimacy status on birth certificates or for illegitimate births not registered, because of the present lack of knowledge about these two groups.[17]

The growth in the number of illegitimate births has been substantial both for the white and nonwhite groups. For the latter, the number rose in each year, from 49,200 in 1940 to 141,800 in 1960—nearly a threefold increase. For the white group there was little change until well after the start of World War II. Between 1943 and 1946, however, illegitimate births to white mothers increased from 42,800 to 61,400. Although the figure declined during the next 5 years, it remained well above prewar levels. Beginning with 1952 it again moved upward to reach new record figures of 79,600 in 1959 and 82,500 in 1960.

The magnitude of these increases is undoubtedly overstated because of the differential bias in registration completeness. If the crude assumption is made that illegitimate births are underregistered to the same extent as all births, the corresponding increases between 1940 and 1960 in the number of white and nonwhite illegitimate births would be 94 percent and 143 percent, respectively. Ac-

[17] National Office of Vital Statistics, "Illegitimate Births: United States, 1938-57," by Joseph Schachter and Mary McCarthy, *Vital Statistics—Special Reports*, Vol. 47, No. 8, 1960.

cording to unadjusted data, the corresponding increases were 105 and 188 percent.

The frequency of illegitimate births in relation to the size of the population "at risk" is expressed by the illegitimacy rate—illegitimate births per 1,000 unmarried women 15-44 years of age. In 1940 the estimated rate was only 7.1. However, it has risen each year since then, and at present is three times as large. This rise is reflected in large increases in rates for practically every 5-year age of mother group since 1940 (table 1-X). During most of this period, the changes resulted not only from successively larger numbers of births out of wedlock but also from concomitant decreases in the rate base—the unmarried female population of reproductive age.

Another measure for certain types of comparison is the illegitimacy ratio, that is, the number of illegitimate live births per 1,000 total live births. This ratio is not a substitute for the illegitimacy rate. It provides a useful statistic, however, in connection with the administration of programs concerned with children born out of wedlock. The illegitimacy ratio has been rising during the past 8 years, and in 1960 it was 53, the highest on record. In the years prior to 1953 it appears to have fluctuated more or less erratically, varying within the bounds of 33.4 and 42.9.

In 1960, as in previous years, a relatively large proportion of births to teenage girls were out of wedlock. The illegitimacy ratio among the age group 15-19 years was 148 compared with 48 for those 20-24 years and 29 for those 25-29. A total of 48,300 of the illegitimate live births in 1960 occurred among girls under 18 years of age (table 1-W).

What proportion of unwed mothers have had several children out of wedlock? While no definitive answer is available from birth-record data, they do provide an upper bound of the relative frequency. The total number of previous births to the mother is stated on the certificate, and except for those who reported incorrectly, none of the primiparas could be repeaters. Even for those who report their second or third births as illegitimate births, not all of their previous deliveries occurred out of wedlock; there is no indication on the birth record of the marital status at the time of these earlier pregnancies.

About half of the unmarried women who had a child in 1960 stated that this was their first child. For about one-fifth of the deliveries out of wedlock it was the second child, and for nearly 11 percent, it was the third. These figures differed significantly for the two color groups. The proportion of illegitimate births which were of second or higher parity was 60 percent for the nonwhite group and 35 percent for the white.

The estimated illegitimacy ratio for the nonwhite group (215.8) in 1960 was nearly 10 times that for the white (22.9). In 1960, for the first time since 1948 this ratio decreased for the nonwhites, while it continued to increase for the white group. It is generally believed that there is a relatively greater understatement of illegitimacy in the white group than in the nonwhite. This understatement, however, is probably only partly responsible for the wide difference between the illegitimacy ratios for these two groups.

The numbers of illegitimate births per 1,000 total births by color are shown in table 1-U for the States which report this item. In 1960, as in recent years, the District of Columbia had the highest ratio (55.8) for the white group. The ratio for the nonwhite was highest in Delaware (347.7), followed by Tennessee (295.9) and West Virginia (292.1).

State comparisons of these ratios are affected by differences in such factors as: (1) amount of misstatements on the birth record to conceal legitimacy status, (2) differences in birth registration completeness between legitimate and illegitimate births, and (3) marital status and age composition of the female population. The first point is undoubtedly the most serious source of bias in legitimacy statistics and may vary appreciably from State to State. Considering the present level of registration completeness, the second factor can be significant in only a few areas.

Birth weight

A great majority of the children born in 1960 (more than 92 percent) weighed over 2,500 grams (table 1-Z). The remaining 7.7 percent represented immature births according to the birth weight criterion.[18] This group, although constituting a small portion of total births, is important because immature infants require special care. Immaturity was listed as the cause of death in 61 percent of the cases of neonatal mortality in 1959.

The peak concentration of births was between 3,001 and 3,500 grams. Nearly two-fifths of the births in 1960 were at these weights. The median weight for all children was 3,310 grams. Only a small proportion of infants (1.6 percent) weighed over 4,500 grams. Extremely large babies, those weighing 5,001 grams or more, were very rare—0.2 percent of all births.

Nonwhite babies weighed, on the average, 190 grams less at birth than white babies. The percent of nonwhite infants with birth weights of 2,500 grams or less was 12.8 compared with 6.8 for white infants. The proportion of infants falling into the three lowest weight categories was twice as great for nonwhites as for whites. At the other end of the weight scale (4,501 grams or more) the proportions for the white and nonwhite groups were about the same.

Since 1950, the first year for which data on birth weight were available, the percentage of immature babies among all births in this country has varied only slightly (between 7.5 and 7.7 percent). During this same period the comparable proportion dropped a little among the white group (from 7.2 percent in 1950 to 6.8 in 1960), but the percentages among the nonwhite group increased (from 10.4 percent in 1950 to 12.9 in 1959). This may result from several reasons. There has been a sizable reduction (6.4 to 0.8 percent) in the relative number of birth weights "not stated" for nonwhite infants during this same period. More precise measuring and reporting of birth weight may have taken place. Improvements in prenatal and obstetrical care have been made since 1950 which would tend to increase the proportion of immature babies surviving to delivery.

---

[18] See discussion of birth weight in Technical Appendix.

Birth weight by geographic division.—The distribution of births by weight varied appreciably from area to area (table 1-Y). Among the nonwhite, the proportion of children born prematurely ranged from a high of 15.1 percent for the residents of the Middle Atlantic Division to a low of 10.3 in the Pacific Division. For the white group, the proportion weighing 2,500 grams or less was, however, highest in the Mountain Division (8.4 percent) and lowest in the West North Central (6.0 percent).

In all divisions the percentages of immature births were greater in the nonwhite group than in the white. The differential between these proportions, however, varied considerably. It was highest in the Middle Atlantic Division and smallest in the Mountain Division.

Also noteworthy are the comparatively large proportions of nonwhite infants in the Southern divisions falling into the high birth weight groups (4,501 grams or more). In most other divisions, the percentages of nonwhite children weighing this much were considerably smaller and were generally lower than for the white.

Birth weight by age of mother.—Table 1-Z shows that the percent of immature births was highest among very young mothers (under 20 years of age). This proportion decreased in each of the next two age groups and increased thereafter. Average birth weight, however, generally increased with age of mother and did not reflect the rise in the percentage of immature births in the latter reproductive years. Because of the high correlation between age of mother and birth order, variation in the incidence of immaturity with age of mother may also be related to concomitant changes in birth order. This relationship has been explored in a study based on births in the first 3 months of 1950.[19]

Birth rates by State

In 1960 as in previous years, the crude birth rate varied substantially from State to State (table 1-AB). Alaska ranked first with 33.4 births per 1,000 population. New Mexico, which in the past has generally had the highest rate, ranked second, with a rate of 32.3. The lowest birth rates were recorded for West Virginia (21.2) and Pennsylvania (21.3). Of the remaining States and the District of Columbia, the rates for 19 States were from 25.0 to 29.9, and for 28, from 20.0 to 24.9.

Birth rates are generally lowest in the Middle Atlantic Division and highest in the Mountain Division. However, there is considerable variability within some of these groups. For example, in the Pacific Division, rates varied from 33.4 for Alaska to 21.7 for Oregon, ranking first to 47th, respectively, among the 50 States and the District of Columbia. While the differences in rates among the States is still sizable, it is less than in former years. In 1940, for example, the coefficient of variation with regard to State rates was 20.7 percent compared with 10.1 percent for 1960.[20] This change has resulted from the marked increases since 1940 in the low rate areas:

AREA	1960	1950	1940	PERCENT CHANGE		
				1940 to 1960	1950 to 1960	1940 to 1950
UNITED STATES	23.7	24.1	19.4	+22.2	-1.7	+24.2
New England	22.5	21.0	15.9	+41.5	+7.1	+32.1
Middle Atlantic	21.5	20.7	15.6	+37.8	+3.9	+32.7
East North Central	24.2	23.7	17.7	+36.7	+2.1	+33.9
West North Central	24.0	24.0	18.4	+30.4	0	+30.4
South Atlantic	24.2	26.3	24.1	+0.4	-8.0	+9.1
East South Central	24.4	27.5	25.4	-3.9	-11.3	+8.3
West South Central	25.4	27.3	23.8	+6.7	-7.0	+14.7
Mountain	27.3	28.8	24.0	+13.8	-5.2	+20.0
Pacific	23.6	23.5	16.6	+42.2	+0.4	+41.6

Birth rates by age of mother and State

Table 1-AC relates the number of births to mothers in a 5-year age group to the female population of the same age for each State and the District of Columbia. The pattern for both color groups in all States generally corresponds to that of the United States as a whole, with few births at the extremes of the childbearing period and the maximum number of births to females aged 20-24 years. These data indicate that with few exceptions the nonwhites maintain a higher rate of fertility than the white group throughout the childbearing period.

In the following comparison of States and divisions, the fertility rate for women aged 15-44 is used. The pattern of these rates among the States was generally similar to that of the crude birth rates. Alaska and New Mexico with rates of 169 and 156, respectively, had the highest. West Virginia, however, was third lowest (105.5), while Pennsylvania (104.7) and New York (104.9) recorded the lowest rates. In comparing geographic differences, the rates are again lowest for the Middle Atlantic Division and highest for the Mountain Division.

The highs and lows of the fertility rates by State and geographic division did not change appreciably from 1950 to 1960. The only decrease in this rate for this period occurred in West Virginia where the 1960 rate was 5.6 percent below that for 1950. The District of Columbia showed the largest percent increase (28.0), attributable mainly to the rise in the fertility rate for the nonwhite group.

In terms of changes in rates for the geographic divisions between the two decades, the greatest increases took place in the New England and Middle Atlantic States where the rates were lowest in 1950; the smallest increases in rates were found in the East South Central and Mountain States where the 1950 rates were the highest.

[19] National Office of Vital Statistics, "Weight at Birth and Survival of Newborn, by Age of Mother and Total-Birth Order: United States, Early 1950," by Jeanne Loeb, *Vital Statistics—Special Reports*, Vol. 47, No. 2, 1958.

[20] The coefficient of variation is the ratio of the standard deviation for the series to the arithmetic mean for the same series, expressed as a percent.

Birth Rates and Fertility Rates by Standard Metropolitan Statistical Areas

In 1960 about 64 percent of all live births were to residents of the 201 standard metropolitan statistical areas (SMSA's). The crude birth rate for these areas in 1960 was 24.0 births per 1,000 enumerated population, slightly higher than the rate of 23.3 for all nonmetropolitan areas and 23.7 for the entire Nation. The fertility rate, a more refined measure, reveals a different picture. The total number of live births per 1,000 enumerated female population aged 15-44 years for the SMSA's is lower than that for the nonmetropolitan areas and for the Nation as a whole, as indicated in the table below. The metropolitan counties in the table correspond to all SMSA's in the respective geographical regions. The 1960 data are shown according to the 1960 definition of SMSA's; the 1950 data are shown according to the 1950 definition. Because of these differences in definition and because of modifications in SMSA boundaries during the decade, the SMSA's in 1960 are not strictly comparable to those in 1950; however, these changes do not impair the comparisons. Both the 1950 and the 1960 figures represent registered births.

While the fertility rates for the SMSA's were lower by 5.5 percent than those for the nonmetropolitan area for the Nation as a whole, this pattern was not maintained from one geographic division to another. Fertility rates for the SMSA's in the New England and Mountain Divisions were about 10 percent less than for the nonmetropolitan areas. In sharp contrast, the fertility rates for the population of the SMSA's in the West South Central and the West North Central Divisions are greater than for the nonmetropolitan population. In almost every geographical division and for the United States as a whole the fertility rate for the SMSA's increased at a greater rate during the decade 1950 to 1960 than that for all other areas.

Among the 24 large SMSA's with a population of one million inhabitants or more, Minneapolis-St. Paul registered the highest fertility rate (134.5) in 1960. The lowest rate was 97.1 for the Patterson-Clifton-Passaic area of New Jersey (table 1-AD).

Differences in fertility between the white and nonwhite groups were recorded for all SMSA's. Among the 24 largest SMSA's the smallest difference between the fertility rates for the two groups is found in Detroit. In this SMSA, the nonwhite fertility rate was 7.1 percent higher than that for the white. The greatest difference in fertility rates by color group for SMSA's with one million inhabitants or more was recorded for San Diego, California, where the nonwhite rate is 64.0 percent greater than that for the whites.

AREA	BIRTH RATE		FERTILITY RATE		
	1960	1950	1960	1950	Percent change

[1]For 1941-46, based on population including Armed Forces abroad.
[2]Beginning 1959, includes Alaska, and beginning 1960, includes Hawaii.
[3]Based on a 50-percent sample of births.
[4]Increased in number from 10 States and the District of Columbia in 1915 to the entire conterminous United States in 1933.

Table 1-B. Live Births, Birth Rates, and Fertility Rates, by Color: United States, 1909-60

(Data refer only to births occurring within the United States. Beginning 1959, includes Alaska, and beginning 1960, includes Hawaii. Birth rates per 1,000 population residing in area for specified group. Fertility rates per 1,000 female population aged 15-44 years in specified group. Rates for 1940, 1950, and 1960 are based on population enumerated as of April 1; for all other years estimated as of July 1)

YEAR	NUMBER			BIRTH RATE[1]			FERTILITY RATE

[1]For 1917-19 and 1941-46, based on population including Armed Forces abroad.
[2]Based on a 50-percent sample of births.
[3]Figures are rounded to the nearest thousand without being adjusted to totals which are independently rounded. For 1915-32, includes adjustments for States not in the registration area; for years prior to 1915, figures are estimates based on the number of registered births in the 10 original registration States for the same period. Estimates for 1909-34 were prepared by P.K. Whelpton. See National Office of Vital Statistics, "Births and Birth Rates in the Entire United States, 1909 to 1948," Vital Statistics—Special Reports, Vol. 33, No. 8, 1950.

Table 1-C. Age-Sex-Adjusted Birth Rates, by Color: United States, 1940-60

(Beginning 1959, includes Alaska, and beginning 1960, includes Hawaii. Rates per 1,000 population. Computed by the direct method, using as the standard populations the age distribution of the female population aged 10-49 years as enumerated in 1940 and the total enumerated population of the United States for that year; see text in this section. Based on birth rates by age of mother and color shown in table 1-E)

YEAR	Total	White	Nonwhite
REGISTERED BIRTHS			
1960	31.2	30.2	38.8
1959	31.2	30.1	39.3
BIRTHS ADJUSTED FOR UNDERREGISTRATION			
1959	31.6	30.3	40.8
1958	31.5	30.3	40.4
1957	32.1	30.8	41.1

[1]Rates computed by relating total births, regardless of age of mother, to female population aged 15-44 years.
[2]Rates computed by relating births to mothers aged 45 years and over to female population aged 45-49 years.
[3]Based on a 50-percent sample of births.

664691 O - 62 - 4

Table 1-F. Birth Rates by Live-Birth Order and Color: United States, 1940-60

(Data refer only to births occurring within the United States. Beginning 1959, includes Alaska, and beginning 1960, includes Hawaii. Rates are live births per 1,000 female population aged 15-44 years in specified group, enumerated as of April 1 for 1940, 1950, and 1960, and estimated as of July 1 for all other years. Live-birth order refers to number of children born alive to mother. Figures for births of order not stated are distributed, including births that occurred in Massachusetts, which did not require reporting of birth order)

Rates are live births per 1,000 female population in specified group, enumerated as of April 1. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and births of order not stated are distributed, including births that occurred in Massachusetts, which did not require reporting of birth order)

[1]Rates computed by relating total births, regardless of age of mother, to female population aged 15-44 years.
[2]Rates computed by relating births to mothers aged 45 years and over to female population aged 45-49 years.

Table 1-K. Birth Rates Adjusted for Underregistration, by Live-Birth Order, for Native White Women: United States, 1920-59

(Data refer only to births occurring within the United States. Beginning 1959, includes Alaska. Includes adjustments for States not in the birth-registration area prior to 1933. Rates are live births per 1,000 native white female population aged 15-44 years. Live-birth order refers to number of children born alive to mother. Figures for births of order not stated are distributed, including births that occurred in Massachusetts, which did not require reporting of birth order)

[1]Based on a 50-percent sample of births.

NOTES:

Estimates for 1920-39 prepared by P. K. Whelpton. See National Office of Vital Statistics, "Births and Birth Rates in the Entire United States, 1909 to 1948, "Vital Statistics—Special Reports, Vol. 33, No. 8, 1950.

Population bases for 1920-39, estimated as of July 1 by P. K. Whelpton; for 1940 and 1950, enumerated as of April 1; for 1941-49, estimated as of April 1 by the National Office of Vital Statistics; and for 1951-59, estimated as of July 1 by the U.S. Bureau of the Census.

Table 1-L. Birth Rates by Age of Father and Color: United States, 1940, 1950, 1955 1959, and 1960

(Data refer only to births occurring within the United States. Beginning 1959, includes Alaska, and beginning 1960, includes Hawaii. Rates are live births per 1,000 male population residing in area for specified group, enumerated as of April 1 for 1940, 1950, and 1960, and estimated as of July 1 for 1955 and 1959. Figures for age of father not stated are distributed)

Table 1-N. Birth Probabilities for Specified Years, by Exact Age and Parity of Mother at Beginning of Year: United States, 1940, 1950, and 1956-60

(Beginning 1959, includes Alaska, and beginning 1960, includes Hawaii. Based on births adjusted for underregistration and numbers of women adjusted for underenumeration and misstatements of age in the censuses. Probabilities are the number of births per 1,000 estimated female population in specified parity and exact age group. Figures in the "0 parity" column show the probability of first births to "0 parity" women, those in the "1 parity" column show the probability of second births to "1 parity" women, etc. For definition of parity, see text in this section)

[1]Computed to nearest 10 grams on basis of exact conversion of interval limits from pounds and ounces.
[2]Equivalents of the gram weights in terms of pounds and ounces are as follows:

1,000 grams or less = 2 lb. 3 oz. or less
1,001-1,500 grams = 2 lb. 4 oz. - 3 lb. 4 oz.
1,501-2,000 grams = 3 lb. 5 oz. - 4 lb. 6 oz.
2,001-2,500 grams = 4 lb. 7 oz. - 5 lb. 8 oz.
2,501-3,000 grams = 5 lb. 9 oz. - 6 lb. 9 oz.
3,001-3,500 grams = 6 lb. 10 oz. - 7 lb. 11 oz.
3,501-4,000 grams = 7 lb. 12 oz. - 8 lb. 13 oz.
4,001-4,500 grams = 8 lb. 14 oz. - 9 lb. 14 oz.
4,501-5,000 grams = 9 lb. 15 oz. - 11 lb. 0 oz.
5,001 grams or more = 11 lb. 1 oz. or more

Table 1-Z. Distribution of Live Births by Birth Weight, by Age of Mother, and Color: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Figures for age of mother and birth weight not stated are distributed)

AGE OF MOTHER AND COLOR	Median weight in grams[1]	PERCENTAGE DISTRIBUTION BY BIRTH WEIGHT[2]											
		Total	1,000 grams or less	1,001-1,500 grams	1,501-2,000 grams	2,001-2,500 grams	2,500 grams or less	2,501-3,000 grams	3,001-3,500 grams	3,501-4,000 grams	4,001-4,500 grams	4,501-5,000 grams	5,001 grams or more

[1] Computed to nearest 10 grams on basis of exact conversion of interval limits from pounds and ounces.

[2] Equivalents of the gram weights in terms of pounds and ounces are as follows:

1,000 grams or less = 2 lb. 3 oz. or less
1,001-1,500 grams = 2 lb. 4 oz. - 3 lb. 4 oz.
1,501-2,000 grams = 3 lb. 5 oz. - 4 lb. 6 oz.
2,001-2,500 grams = 4 lb. 7 oz. - 5 lb. 8 oz.
2,501-3,000 grams = 5 lb. 9 oz. - 6 lb. 9 oz.
3,001-3,500 grams = 6 lb. 10 oz. - 7 lb. 11 oz.
3,501-4,000 grams = 7 lb. 12 oz. - 8 lb. 13 oz.
4,001-4,500 grams = 8 lb. 14 oz. - 9 lb. 14 oz.
4,501-5,000 grams = 9 lb. 15 oz. - 11 lb. 0 oz.
5,001 grams or more = 11 lb. 1 oz. or more

Table 1-AA. Live Births to Nonresidents in Each State and Live Births to Residents in Other States: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Unit of residence is defined as the county or county equivalent of which the mother was a resident)

Table 1-AB. Birth Rates: United States, Each Division and State, 1950-60

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. For 1951-54 and 1956-60, based on a 50-percent sample of births. Rates are live births per 1,000 population in each area, enumerated as of April 1 for 1950 and 1960, and estimated as of July 1 for all other years)

DIVISION AND STATE	RATES BASED ON REGISTERED BIRTHS		RATES BASED ON BIRTHS ADJUSTED FOR UNDERREGISTRATION

[1]Rates computed by relating total births, regardless of age of mother, to female population aged 15-44 years.
[2]Rates computed by relating births to mothers aged 45 years and over to female population aged 45-49 years.

Table 1-AD. Live Births, Birth Rates, and Fertility Rates, by Color, for Standard Metropolitan Statistical Areas of the United States: 1960

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample of births. Rates per 1,000 population in specified group, enumerated as of April 1. Birth rates based on total population; fertility rates based on female population aged 15-44 years. Areas shown are those listed in Standard Metropolitan Statistical Areas issued in 1961 by the Bureau of the Budget, except for New England, where areas are metropolitan State economic areas as established by the Bureau of the Census in 1960. For definitions of areas, see Technical Appendix)

[1]Comprised of four standard metropolitan statistical areas--New York, N.Y., Newark, N.J., Jersey City, N.J., Paterson-Clifton-Passaic, N.J.--and two nonmetropolitan counties--Middlesex and Somerset Counties, N.J.

[2]Comprised of two standard metropolitan statistical areas--Chicago, Ill., and Gary-Hammond-East Chicago, Ind.

Section 2. Natality – Characteristics: Tables

General Tables | Page

2-1. Live births by State of occurrence distributed according to State of residence: United States and each State, 1960 ---------- 2-1

2-2. Live births by month: United States and each State, 1960 ---------- 2-4

2-3. Live births by month and color: United States and each State, 1960 ---------- 2-5

2-4. Live births by specified race and sex: United States and each State, 1960 ---------- 2-7

2-5. Live births by plurality of birth and color: United States and each State, 1960 ---------- 2-8

2-6. Live births by birth weight, plurality of birth, color, and sex: United States, 1960 ---------- 2-9

2-7. Live births by birth weight, age of mother, plurality of birth, and color: United States, 1960 ---------- 2-10

2-8. Live births by birth weight and color: United States and each State, 1960 ---------- 2-12

2-9. Live births by birth weight, period of gestation, and color: United States, 1960 ---------- 2-14

2-10. Live births by sex of child and age of mother, by plurality of birth, period of gestation, and color: United States, 1960 ---------- 2-15

2-11. Live births by period of gestation and color: United States and each State, 1960 ---------- 2-17

2-12. Live births by month, age of mother, live-birth order, and color: United States, 1960 ---------- 2-20

2-13. Live births by age of mother, live-birth order, sex of child, color, and nativity of white mother: United States, 1960 ---------- 2-22

2-14. Live births by age of mother, live-birth order, color, and nativity of white mother: Each State, 1960 ---------- 2-24

2-15. Live births by single year of age of mother, live-birth order, color, and nativity of white mother: United States, 1960 ---------- 2-56

2-16. Live births by age of mother and color, for metropolitan and nonmetropolitan counties: United States and each State, 1960 ---------- 2-59

2-17. Live births by age of mother and color, for standard metropolitan statistical areas of the United States: 1960 - 2-65

2-18. Live births by live-birth order and color, for metropolitan and nonmetropolitan counties: United States and each State, 1960 ---------- 2-73

2-19. Live births by live-birth order and color, for standard metropolitan statistical areas of the United States: 1960 ---------- 2-79

2-20. Live births by age of father, age of mother, sex of child, and color: United States, 1960 ---------- 2-87

2-21. Live births by age of father, sex of child, and color: United States and each State, 1960 ---------- 2-89

2-22. Illegitimate live births by age of mother and color, for urban and rural areas and specified urban places: 35 reporting States, 1960 ---------- 2-95

2-23. Illegitimate live births by live-birth order and color: 35 reporting States, 1960 ---------- 2-105

Table 2-1. Live Births by State of Occurrence Distributed According to State of Residence: United States and Each State, 1960

(Based on a 50-percent sample. Unit of residence is defined as the county or county equivalent of which the mother was a resident)

STATE OF OCCURRENCE	Total births occurring in State	Births to residents occurring in county of residence	BIRTHS TO NONRESIDENTS															
			Total	Intra-state non-residents	Interstate nonresidents

[1]Equivalents of the gram weights in terms of pounds and ounces are as follows:

1,000 grams or less = 2 lb. 3 oz. or less
1,001-1,500 grams = 2 lb. 4 oz. - 3 lb. 4 oz.
1,501-2,000 grams = 3 lb. 5 oz. - 4 lb. 6 oz.
2,001-2,500 grams = 4 lb. 7 oz. - 5 lb. 8 oz.
2,501-3,000 grams = 5 lb. 9 oz. - 6 lb. 9 oz.
3,001-3,500 grams = 6 lb. 10 oz. - 7 lb. 11 oz.
3,501-4,000 grams = 7 lb. 12 oz. - 8 lb. 13 oz.
4,001-4,500 grams = 8 lb. 14 oz. - 9 lb. 14 oz.
4,501-5,000 grams = 9 lb. 15 oz. - 11 lb. 0 oz.
5,001 grams or more = 11 lb. 1 oz. or more

Table 2-7. Live Births by Birth Weight, Age of Mother, Plurality of Birth, and Color: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Figures for age of mother not stated are distributed)

[1]Equivalents of the gram weights in terms of pounds and ounces are as follows:

1,000 grams or less = 2 lb. 3 oz. or less
1,001-1,500 grams = 2 lb. 4 oz. - 3 lb. 4 oz.
1,501-2,000 grams = 3 lb. 5 oz. - 4 lb. 6 oz.
2,001-2,500 grams = 4 lb. 7 oz. - 5 lb. 8 oz.
2,501-3,000 grams = 5 lb. 9 oz. - 6 lb. 9 oz.
3,001-3,500 grams = 6 lb. 10 oz. - 7 lb. 11 oz.
3,501-4,000 grams = 7 lb. 12 oz. - 8 lb. 13 oz.
4,001-4,500 grams = 8 lb. 14 oz. - 9 lb. 14 oz.
4,501-5,000 grams = 9 lb. 15 oz. - 11 lb. 0 oz.
5,001 grams or more = 11 lb. 1 oz. or more

Table 2-8. Live Births by Birth Weight and Color: United States and Each State, 1960

[1]Equivalents of the gram weights in terms of pounds and ounces are as follows:

1,000 grams or less = 2 lb. 3 oz. or less
1,001-1,500 grams = 2 lb. 4 oz. - 3 lb. 4 oz.
1,501-2,000 grams = 3 lb. 5 oz. - 4 lb. 6 oz.
2,001-2,500 grams = 4 lb. 7 oz. - 5 lb. 8 oz.
2,501-3,000 grams = 5 lb. 9 oz. - 6 lb. 9 oz.
3,001-3,500 grams = 6 lb. 10 oz. - 7 lb. 11 oz.
3,501-4,000 grams = 7 lb. 12 oz. - 8 lb. 13 oz.
4,001-4,500 grams = 8 lb. 14 oz. - 9 lb. 14 oz.
4,501-5,000 grams = 9 lb. 15 oz. - 11 lb. 0 oz.
5,001 grams or more = 11 lb. 1 oz. or more

Table 2-9. Live Births by Birth Weight, Period of Gestation, and Color: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Maryland (except city of Baltimore) and Massachusetts did not require reporting of period of gestation. These births are included in the "Not stated" classification for this item)

PERIOD OF GESTATION[1] AND COLOR	Total	BIRTH WEIGHT[2]

[1]Period of gestation reported in months allocated to gestation intervals in weeks as follows: 4 months to "Under 20 weeks"; 5 and 6 months to "20-27 weeks"; 7 months to "28-31 weeks"; 8 months to "32-35 weeks"; 9 months and over to "40 weeks and over."

[2]Equivalents of the gram weights in terms of pounds and ounces are as follows:

1,000 grams or less = 2 lb. 3 oz. or less
1,001-1,500 grams = 2 lb. 4 oz. - 3 lb. 4 oz.
1,501-2,000 grams = 3 lb. 5 oz. - 4 lb. 6 oz.
2,001-2,500 grams = 4 lb. 7 oz. - 5 lb. 8 oz.
2,501-3,000 grams = 5 lb. 9 oz. - 6 lb. 9 oz.
3,001-3,500 grams = 6 lb. 10 oz. - 7 lb. 11 oz.
3,501-4,000 grams = 7 lb. 12 oz. - 8 lb. 13 oz.
4,001-4,500 grams = 8 lb. 14 oz. - 9 lb. 14 oz.
4,501-5,000 grams = 9 lb. 15 oz. - 11 lb. 0 oz.
5,001 grams or more = 11 lb. 1 oz. or more

Table 2-10 Live Births by Sex of Child and Age of Mother, by Plurality of Birth, Period of Gestation, and Color: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Maryland (except city of Baltimore) and Massachusetts did not require reporting of period of gestation. These births are included in the "Not stated" classification for this item. Figures for age of mother not stated are distributed)

Table 2-11. Live Births by Period of Gestation and Color: United States and Each State, 1960—Continued

(By place or residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Maryland (except city of Baltimore) and Massachusetts did not require reporting of period of gestation. These births are included in the "Not stated" classification for this item)

AREA AND COLOR	Total	PERIOD OF GESTATION[1]							
		Under 20 weeks	20-27 weeks	28-31 weeks	32-35 weeks	36 weeks	37-39 weeks	40 weeks and over	Not stated

Nonwhite	288	-	6	4	2	10	26	236	4

[1]Period of gestation reported in months allocated to gestation intervals in weeks as follows: 4 months to "Under 20 weeks"; 5 and 6 months to "20-27 weeks"; 7 months to "28-31 weeks"; 8 months to "32-35 weeks"; 9 months and over to "40 weeks and over."
[2]Data shown are for births in Baltimore and for births in other States to residents of Maryland.
[3]Data shown are for births in other States to residents of Massachusetts.

Table 2-12. Live Births by Month, Age of Mother, Live-Birth Order, and Color: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Births which occurred in Massachusetts are included in the "Not stated" classification for birth order because this State did not require reporting of the item. Figures for age of mother not stated are distributed)

Table 2-13 Live Births by Age of Mother, Live-Birth Order, Sex of Child, Color, and Nativity of White Mother: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Births which occurred in Massachusetts are included in the "Not stated" classification for birth order because this State did not require reporting of the item. Figures for age of mother not stated and nativity of white mother not stated are distributed)

AGE OF MOTHER, SEX OF CHILD, COLOR, AND NATIVITY OF WHITE MOTHER	Total	LIVE-BIRTH ORDER

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-14. Live Births by Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: Each State, 1960—Continued

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-15. Live Births by Single Year of Age of Mother, Live-Birth Order, Color, and Nativity of White Mother: United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Births which occurred in Massachusetts are included in the "Not stated" classification for birth order because this State did not require reporting of the item. Figures for age of mother not stated and nativity of white mother not stated are distributed)

Table 2-16. Live Births by Age of Mother and Color, for Metropolitan and Nonmetropolitan Counties: United States and Each State, 1960

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Figures for age of mother not stated are distributed. The category "metropolitan counties" includes all counties that are in standard metropolitan statistical areas (metropolitan State economic areas for New England) shown in table 2-17. The category "nonmetropolitan counties" includes all other counties. For definitions of metropolitan-nonmetropolitan counties, see Technical Appendix)

Table 2-17. Live Births by Age of Mother and Color, for Standard Metropolitan Statistical Areas of the United States: 1960

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Figures for age of mother not stated are distributed. Areas shown are those listed in "Standard Metropolitan Statistical Areas, 1961," issued by the Bureau of the Budget, except for New England, where areas are metropolitan State economic areas as established by the Bureau of the Census in 1960. For definitions of areas, see Technical Appendix)

[1]Comprised of four standard metropolitan statistical areas: New York, N.Y.; Newark, N.J.; Jersey City, N.J.; Paterson-Clifton-Passaic, N.J.; and two nonmetropolitan counties, Middlesex and Somerset Counties, N.J.

[2]Comprised of two standard metropolitan statistical areas: Chicago, Ill.; and Gary-Hammond-East Chicago, Ind.

Table 2-18. Live Births by Live-Birth Order and Color, for Metropolitan and Nonmetropolitan Counties: United States and Each State, 1960

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. The category "metropolitan counties" includes all counties that are in standard metropolitan statistical areas (metropolitan State economic areas for New England) shown in table 2-17. The category "nonmetropolitan counties" includes all other counties. For definitions of metropolitan-nonmetropolitan counties, see Technical Appendix)

Table 2-19. Live Births by Live-Birth Order and Color, for Standard Metropolitan Statistical Areas of the United States: 1960

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Live-birth order refers to number of children born alive to mother. Areas shown are those listed in "Standard Metropolitan Statistical Areas, 1961," issued by the Bureau of the Budget, except for New England, where areas are metropolitan State economic areas as established by the Bureau of the Census in 1960. For definitions of areas, see Technical Appendix)

[1]Massachusetts did not require reporting of birth order. Birth order data shown are for births in other States to residents of this area.
[2]Comprised of four standard metropolitan statistical areas: New York, N.Y.; Newark, N.J.; Jersey City, N.J.; Paterson-Clifton-Passaic, N.J.; and two nonmetropolitan counties, Middlesex and Somerset Counties, N.J.
[3]Comprised of two standard metropolitan statistical areas: Chicago, Ill.; and Gary-Hammond-East Chicago, Ind.

Table 2-20. Live Births by Age of Father, Age of Mother, Sex of Child, and Color. United States, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Figures for age of mother not stated are distributed)

Table 2-22. Illegitimate Live Births by Age of Mother and Color, for Urban and Rural Areas and Specified Urban Places: 35 Reporting States, 1960

(By place of residence. Data refer only to illegitimate births occurring within the reporting area. Based on a 50-percent sample. Specified urban places are those with populations of 50,000 or more in 1960. Figures for white and nonwhite are shown separately for each State and urban-rural total and for specified urban places in which the 1960 populations for nonwhite formed 10 percent of the total or numbered 10,000 or more. Figures for age of mother not stated are distributed. For definitions of urban-rural areas, see Technical Appendix)

Section 3. Natality–Local Area Statistics: Tables

Table		Page
3-1.	Live births by attendant and color: United States, each State and county, and specified urban places, 1960	3-1
3-2.	Live births by attendant, birth weight, and color, for urban and rural areas, and population-size groups (United States only), in metropolitan and nonmetropolitan counties: United States and each State, 1960	3-59

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1950 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

Table 3-1. Live Births by Attendant and Color: United States, Each State and County, and Specified Urban Places, 1960—Con.

(Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. Specified urban places are those with populations of 10,000 or more in 1960 and are incorporated unless otherwise noted. Figures for white and nonwhite are shown separately for those counties and urban places in which the 1960 populations for nonwhite formed 10 percent or more of the total or numbered 10,000 or more)

YELLOWSTONE NATIONAL PARK, TOTAL	8	4	4	-

*Classified as urban under special rule, see Technical Appendix.
[1]It is assumed that all births in hospitals or institutions are attended by physicians.
[2]"Districts" shown are election districts, the nearest equivalent of counties.
[3]Includes District 1, Prince of Wales.
[4]Includes data for Texarkana, Ark., only.
[5]The cities of Honolulu and Hilo have legally established limits and therefore are treated as incorporated places.
[6]Geographically located within limits of Idaho, Montana, and Wyoming.
[7]Includes data for Bristol, Tenn., only.
[8]Includes data for Texarkana, Tex., only.
[9]Independent cities having populations of less than 10,000 according to the 1960 Census are: Buena Vista, Clifton Forge, Colonial Heights, Galax, Norton, Radford, South Boston, Virginia Beach, and Williamsburg.
[10]Includes data for Bristol, Va., only.
[11]Includes data for Bluefield, W. Va., only.

Table 3-2. Live Births by Attendant, Birth Weight, and Color, for Urban and Rural Areas, and Population-Size Groups (United States Only), in Metropolitan and Nonmetropolitan Counties: United States and Each State, 1960

(By place of residence. Data refer only to births occurring within the United States, including Alaska and Hawaii. Based on a 50-percent sample. For definitions of urban-rural areas and metropolitan-nonmetropolitan counties, see Technical Appendix)

[1]Births attended by other and not specified persons are not shown separately but are included in total births. For the United States these births totaled 8,070 in 1960.
[2]It is assumed that all births in hospitals or institutions are attended by physicians.
[3]Equivalents of the gram weights in terms of pounds and ounces are as follows: 2,500 grams or less = 5 lb. 8 oz. or less; 2,501 grams or more = 5 lb. 9 oz. or more.
[4]Figures are for Woodbridge township, Middlesex County, New Jersey. This township is classified as urban under special rule relating to population size and density, although Middlesex County is not included in a standard metropolitan statistical area and therefore is a nonmetropolitan county.
[5]County equivalents.

Section 4. Natality —Puerto Rico and Virgin Islands (U.S.)

Table		Page
4-1.	Live births by attendant: Puerto Rico, each municipio, and specified urban places, 1960	4-1
4-2.	Live births by attendant and color: Virgin Islands and specified urban place, 1960	4-2
4-3.	Live births and birth rates: Puerto Rico and Virgin Islands, 1940-60	4-2
4-4.	Live births by month, for Puerto Rico and Virgin Islands; and by color for Virgin Islands: 1960	4-3
4-5.	Live births by birth weight for Puerto Rico and Virgin Islands; and by color for Virgin Islands: 1960	4-3
4-6.	Number and ratio of illegitimate live births, by age of mother: Puerto Rico and Virgin Islands, 1960	4-3
4-7.	Live births by age of mother and live-birth order for Puerto Rico and Virgin Islands; and by color for Virgin Islands: 1960	4-4
4-8.	Birth rates by age of mother for Puerto Rico and Virgin Islands; and by color for Virgin Islands: 1960	4-5
4-9.	Live births by age of father and sex of child for Puerto Rico and Virgin Islands; by color for Virgin Islands: 1960	4-5

Table 4-1. Live Births by Attendant: Puerto Rico, Each Municipio, and Specified Urban Places, 1960

(Data refer only to births occurring within Puerto Rico. Specified urban places are those with populations of 10,000 or more in 1960. Based on a 50-percent sample)

AREA	Total births by municipio of occurrence	BIRTHS BY PLACE OF RESIDENCE

Table 4-5. Live Births by Birth Weight for Puerto Rico and Virgin Islands; and by Color for Virgin Islands: 1960

(Data refer only to births occurring within the specified area. Data for Puerto Rico based on a 50-percent sample)

AREA AND COLOR	Total	BIRTH WEIGHT[1]										
		1,000 grams or less	1,001-1,500 grams	1,501-2,000 grams	2,001-2,500 grams	2,501-3,000 grams	3,001-3,500 grams	3,501-4,000 grams	4,001-4,500 grams	4,501-5,000 grams	5,001 grams or more	Not stated
Puerto Rico	76,314	192	360	1,064	5,396	16,940	26,928	18,084	4,922	1,476	144	808
Virgin Islands	1,180	8	16	20	87	289	463	228	62	5	1	1
White	88	-	2	3	4	18	29	24	6	2	-	-
Nonwhite	1,092	8	14	17	83	271	434	204	56	3	1	1

[1]Equivalents of the gram weights in terms of pounds and ounces are as follows:

1,000 grams or less = 2 lb. 3 oz. or less
1,001-1,500 grams = 2 lb. 4 oz. - 3 lb. 4 oz.
1,501-2,000 grams = 3 lb. 5 oz. - 4 lb. 6 oz.
2,001-2,500 grams = 4 lb. 7 oz. - 5 lb. 8 oz.
2,501-3,000 grams = 5 lb. 9 oz. - 6 lb. 9 oz.
3,001-3,500 grams = 6 lb. 10 oz. - 7 lb. 11 oz.
3,501-4,000 grams = 7 lb. 12 oz. - 8 lb. 13 oz.
4,001-4,500 grams = 8 lb. 14 oz. - 9 lb. 14 oz.
4,501-5,000 grams = 9 lb. 15 oz. - 11 lb. 0 oz.
5,001 grams or more = 11 lb. 1 oz. or more

Table 4-6. Number and Ratio of Illegitimate Live Births, by Age of Mother: Puerto Rico and Virgin Islands, 1960

(Data refer only to births occurring within the specified area. Data for Puerto Rico based on a 50-percent sample. Ratios per 1,000 total live births in specified group)

NOTES

Geographic classification

Data are shown by both place of occurrence and place of residence in Puerto Rico for the primary geographic subdivision "municipio," and in the Virgin Islands for St. Croix Island and St. John and St. Thomas Islands (the latter two combined). Births by place of residence are also shown for each urban place having a population of 10,000 or more according to the 1960 census.

Race and color

In 1960, births are not shown by color for Puerto Rico; they are classified as white and nonwhite for the Virgin Islands.

Attendant at birth

In the United States, virtually all in-hospital births are attended by physicians; in Puerto Rico and the Virgin Islands, a large proportion of hospital births are attended by other than physicians.

Completeness of registration

Data for Puerto Rico and the Virgin Islands refer to registered births; no adjustment has been made for possible underreporting. Tests of birth registration completeness were made for these areas in 1950, and the results are given in Volume I of *Vital Statistics of the United States, 1950,* chapter 6.

Population bases for computing rates

Populations used to compute rates in this report were prepared by the U.S. Bureau of the Census.

SECTION 5. TECHNICAL APPENDIX

SOURCES OF DATA

The natality tabulations for 1960, with the exceptions noted in the next paragraph, are based on information from microfilm copies of the original certificates. These copies were received from the registration offices of all States, certain cities, the District of Columbia, Puerto Rico, and the Virgin Islands. The statistical information on these records was edited, classified, placed on punchcards, and tabulated in the National Vital Statistics Division.

The 1960 birth statistics for California, Georgia, Michigan, and New York City were produced by a somewhat different procedure. The vital statistics offices of those areas coded the information on their certificates according to the rules followed in the National Vital Statistics Division. From the punchcards prepared for their own use, they reproduced the information required for national tabulations on uniform punchcard forms. The reproduced cards were verified and tabulated in the National Vital Statistics Division with the cards for the other areas.

Although the United States vital statistics system covers the 50 States, District of Columbia, Puerto Rico, and the Virgin Islands, in the statistical tabulations *United States* refers only to the aggregate of the 50 States and the District of Columbia. Puerto Rico and the Virgin Islands are not integral parts of the United States and therefore for each the statistics are distinct and given separately.

Birth data for the United States are confined to events registered within the United States and, as such, include events occurring to nonresident aliens. The data do not cover any vital events for United States citizens occurring outside the United States. Similarly, the data for Puerto Rico and the Virgin Islands are confined to events registered in those areas.

Standard certificate

The Standard Certificate of Live Birth, issued by the National Vital Statistics Division, has served for many years as the principal means for gaining uniformity in the content of the documents used to collect information. It has been modified in each State to the extent made necessary by the particular needs of the State or by special provisions of the State vital statistics law. However, the certificates of most States conform closely, in content and arrangement, to the standard certificates.

The first issue of the standard certificate of birth appeared shortly before the formation of the registration area. Since then, it has been revised periodically by the national vital statistics agency, in consultation with State health officers and registrars; Federal agencies concerned with vital statistics; national, State, and county medical societies; and others working in the fields of public health, social welfare, demography, and insurance. This revision procedure has assured careful evaluation of each item in terms of its current and future usefulness for registration, identification, legal, medical, and research purposes. New items have been added when necessary, and old items have been modified to ensure better reporting or in some cases dropped when their usefulness appeared to be limited.

The most recent revision ot the standard certificate of live birth occurred in 1955. It was made in close collaboration with the Public Health Conference on Records and Statistics and was recommended to the States for adoption as of January 1, 1956.

The current standard certificate of live birth is shown in figure 5-1.

With a few exceptions, only minor changes in content and format were made in the 1956 revision of the standard certificate. In an effort to obtain more accurate designation for place of residence, the question "Is residence inside city limits?" was added. Studies conducted in a few States had indicated that this question helped to locate correctly the residence of persons living near cities but outside their corporate limits.

Another item, "Is residence on a farm?" was added to serve several purposes. Federal and State agricultural agencies wanted the information to assess the health status of the farm population and to measure changes in its demographic characteristics. It seemed also that this item would aid in correctly allocating place of residence of persons living near but outside cities.

Table 5-A indicates the States that did and those that did not include the check-box items on city and farm residence on all or some of the certificate forms used during 1960.

HISTORY

The first birth statistics published by the Federal Government concerned events in 1850 and were for the entire United States. These statistics were based on information collected during the decennial census of that year. Similar decennial collections were made by census enumerators at each census up to and including the census of 1900, but because of the time interval between the occurrence of a birth and the census enumeration, these reports were inaccurate and incomplete.

The national birth-registration area was not established until 1915, and no birth statistics were published by the Bureau of the Census from 1900 to 1914. The original birth-registration area of 1915 consisted of 10 States and

the District of Columbia. The growth of this area is indicated in table 5-1.

Table 5-1 also presents for each year the estimated midyear population of the United States and the estimated midyear population of those States included in the registration system. From 1933 through 1958 the birth and death statistics for the United States included 48 States and the District of Columbia. Alaska was added in 1959 and Hawaii in 1960.

Because of the growth of the area for which data have been collected and tabulated, a national series of geographically comparable data prior to 1933 can be obtained only by estimation. Annual estimates of births have been prepared by P. K. Whelpton for the period 1909-34 (table 1-B in Section 1). These estimates include an adjustment for States not in the birth-registration area prior to 1933 and for underregistration. In conjunction with annual estimates prepared by the National Office of Vital Statistics (The National Vital Statistics Division since July 1, 1961) for the period 1935-59, they constitute a series of data consistent with respect to geographic coverage and registration completeness.

CLASSIFICATION OF DATA

The principal value of vital statistics data depends upon the computation of rates in which the vital events of a class are related to the population of a similarly defined class. Vital statistics and population statistics must, therefore, be classified according to similarly defined systems and tabulated in comparable groups. Even when the variables common to both, such as geographic area, age, race, and sex, have been similarly classified and tabulated, differences between the enumeration method of obtaining population data and the registration method of obtaining vital statistics data may result in significant discrepancies.

The classification of certain important items is discussed on the following pages.[1]

Classification by occurrence and residence

For the 1960 statistics by place of occurrence, events are classified according to the county in which the vital event took place but to no smaller geographic unit. In the vital statistics for years prior to 1960, place of occurrence was classified by smaller units within the county in the same detail as for statistics by place of residence.

Place of residence in birth statistics refers to the geographical area which constituted the mother's usual residence at time of the birth. The data by place of residence are classified within a county to units as follows: (1) each incorporated place of 10,000 inhabitants or more, (2) each unincorporated place of 10,000 inhabitants or more classified as urban under special rule, (3) the aggregate of incorporated places of 2,500 to 10,000 and unincorporated places of this size defined as urban under special rule, and (4) the residual part of the county. For vital statistics purposes, the residual part of the county is referred to as rural area.

For residence statistics, all events occurring within the United States (i.e., 50 States and the District of Columbia) are allocated to a place of residence within the United States. For nonresident aliens, the place of residence is considered to be the same as the place of occurrence. The events occurring within Puerto Rico are allocated to a residence in Puerto Rico and similarly for the Virgin Islands.

Geographic classification[2]

Standard metropolitan statistical areas.—The standard metropolitan statistical areas (SMSA's) used in this report are essentially the same as those established by the Bureau of the Budget and used by the Bureau of the Census. The only differences occur in the New England States.

Except in the latter States, an SMSA is a county or a group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000, in the 1960 census. In addition, contiguous counties are included in an SMSA if, according to specified criteria, they are (a) essentially metropolitan in character, and (b) socially and economically integrated with the central city or cities.[3]

In New England, the Bureau of the Budget uses as geographic components of the SMSA, towns and cities, rather than counties. The National Vital Statistics Division cannot use the SMSA classification in these States because its data are not coded to identify all towns. Instead, the metropolitan State economic area (MSEA), established by the Bureau of the Census, which is made up of county units, is used.[4]

Standard consolidated areas.—For the metropolitan complexes around New York and Chicago, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria for SMSA's but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively.[5]

---

[1]The complete rules followed in the classification of geographic and personal items for births and deaths are set forth in *Vital Statistics Instruction Manual*, Part II, Section B, "Coding and Punching Geographic and Personal Particulars—Births, Deaths, and Fetal Deaths Occurring in 1960," National Office of Vital Statistics, Washington, 1960.

[2]The rules followed in the classification of geographic area for births are set forth in Part II, Section B, of the instruction manual cited in reference in footnote 1. The geographic code structure is given in *Vital Statistics Instruction Manual*, Part II, Section C, "Coding and Punching Geographic Codes for Births, Deaths, and Fetal Deaths Occurring in 1960-61," National Office of Vital Statistics, Washington, 1961.

[3]For a more complete discussion, see *U.S. Census of Population: 1960, Number of Inhabitants, United States Summary*, Final Report PC(1)-1A, U.S. Bureau of the Census. Washington, U.S. Government Printing Office, 1960; and *Standard Metropolitan Statistical Areas*, Bureau of the Budget. Washington, U.S. Government Printing Office, 1961.

[4]U.S. Bureau of the Census, *State Economic Areas*. Washington, U.S. Government Printing Office, 1951 (revised for 1960).

[5]See footnote 3.

Metropolitan and nonmetropolitan counties.—Counties which are included in SMSA's or, in New England, MSEA's are called metropolitan counties; all other counties are classified as nonmetropolitan.

Urban and rural areas.—The urban population consists of inhabitants residing in the following places:

1. Each incorporated city, borough, village, and town of 2,500 inhabitants or more (except towns in New England, New York, and Wisconsin).

2. Each town in New England and each township in New Jersey and Pennsylvania that has no incorporated municipality as a subdivision and has either 25,000 inhabitants or more or a population of 2,500 to 25,000 and a density of 1,500 persons or more per square mile.[6]

3. Each county in States other than the New England States, New Jersey, and Pennsylvania that has no incorporated municipality within its boundary and has a density of 1,500 persons or more per square mile.[7]

The rural population consists of inhabitants residing in all other areas.

This classification differs from the 1960 census definition of urban population. The latter definition includes, in addition, persons living in (a) unincorporated places of 2,500 inhabitants or more not included in the above definition of "urban," and (b) incorporated and unincorporated places of less than 2,500 inhabitants located within urban fringes of urbanized areas.

It was not feasible to use the 1960 census definitions of urban and rural for classifying vital statistics data since (a) boundary delineations for many urban unincorporated places were made by the Bureau of the Census for enumeration purposes only; many unincorporated places do not conform to political units and their boundaries change with population growth; in most instances the residence information on vital records is insufficient to allocate residence to arbitrary delimitations of unincorporated areas; (b) vital statistics were not tabulated separately for places of less than 2,500 inhabitants.

Vital statistics data for 1960 are classified as urban or rural according to the population of the area enumerated in the 1960 census.

Age of mother and birth order

The birth certificate asks for "Age (at time of this birth)." Some sources of minor errors in the age data are apparent. A small number of records are filed with age not reported, and some births are not registered. In previous reports, the small number of "not stated" ages were shown separately. In this report, not stated ages of mother have been distributed. However, the number of not stated" age of father is relatively large because information on the father is usually not stated for illegitimate births. Therefore, these are shown separately and are not distributed. Measures of variation of completeness of registration with age of mother are available from tests of completeness in 1950 and 1940. They show that registration completeness is approximately the same for all ages, except for the oldest age group, where it is lower.[8]

The 1950 test of registration completeness indicated that registration completeness decreased slightly with each higher birth order. Whereas first births were 99 percent registered, eighth and higher order births were only 93 percent registered.[9]

The matched birth certificates and census records obtained in the same tests also provide information on the consistency of age reporting in these two sources. An analysis of the 1950 data indicates a high degree of consistency, particularly when the ages are combined in the usual 5-year age groups.[10]

Differences in reported birth order are considerably greater, particularly for the higher orders. For each birth order, the order stated on the census record tends to be lower than that given on the birth certificate. It is probable, but not definitely known, that birth order is reported more accurately on the birth certificate than on the census record.

A small percentage of birth records in all States omit information on birth order. More serious is the complete omission of this item from the birth certificate form in Massachusetts. To obtain birth-order and parity-specific rates for the entire United States it is necessary to include estimates for Massachusetts.

Race and color

Births in the United States in 1960 are classified for vital statistics into white, Negro, American Indian, Chinese, Japanese, Aleut, Eskimo, Hawaiian and Part-Hawaiian (combined), and "other nonwhite."

The category "white" includes, in addition to persons reported as "white" those reported as Mexican or Puerto Rican. With one exception, a reported mixture of Negro with any other race is included in the Negro group; other mixed parentage is classified according to the race of the nonwhite parent and mixtures of nonwhite races to the race of the father. The exception refers to a mixture of Hawaiian and any other race, which is classified as Part-Hawaiian.

In most tables less detailed classifications are used—"white," "Negro," and "other" or just "white" and "nonwhite."

Completeness of birth registration in 1960 for "white" births is estimated to be 99.3 percent and for "nonwhite"

---

[6] These areas are identified by the symbol (UT) in table 30 of the U.S. Bureau of the Census publication cited in reference in footnote 3.

[7] Arlington County, Virginia, is the only county in this category.

[8] National Office of Vital Statistics, *Vital Statistics of the United States, 1950*, Volume I. Washington, U.S. Government Printing Office, 1954. ch. 6, p. 127.

[9] Ibid.

[10] National Vital Statistics Division, "Matched Record Comparison of Birth Certificate and Census Information: United States, 1950," by Joseph Schachter, *Vital Statistics—Special Reports*, Vol. 47, No. 12, 1962.

births, 96.4 percent. The most recent figures for other groups are from the 1950 test which indicated registration completeness at that time to be 85.1 percent for American Indians and 97.4 percent for "other races," chiefly Chinese and Japanese. Both figures are probably higher for 1960, but more precise estimates are not available.

A comparison of the race designation in matched sets of birth certificates and census records from the 1950 registration completeness test indicates very high agreement for whites and Negroes. There were, however, substantially fewer American Indians recorded on birth records than on census records.[11] (See Section 1 in this volume for further discussion of the birth statistics by race.)

Illegitimate births

The following 16 States did not report legitimacy status on the birth record in 1960: Arizona, Arkansas, California, Colorado, Connecticut, Georgia, Idaho, Maryland, Massachusetts, Montana, Nebraska, New Hampshire, New Mexico, New York, Oklahoma, and Vermont.

Figures for the United States as a whole were derived by adding an estimate of the number of illegitimate live births in States for which legitimacy data were not available to the number of illegitimate live births tabulated for the reporting States. No adjustments were included for misstatements on the birth records or for failures to register births. The figures are based on a 50-percent sample of illegitimate live births in the reporting States.

There are no quantitative data on the characteristics of the unwed mothers who may be misreporting legitimacy status. Another source of error is the failure to register births at all. It may well be that underregistration is greater in the illegitimate group than in the legitimate.

For illegitimate births reported as second or higher birth orders, it is not known whether previous deliveries to the mother occurred out of wedlock since the marital status of the mother at the time of these earlier pregnancies is not available from the birth record.[12]

Attendant at birth

The term "attended by physician," as used in this publication, includes births attended by physicians out of hospitals and all births in hospitals or institutions. Births are classified as occurring "in hospital or institution" on the basis of entries on the birth certificate. The classification is unrelated to American Hospital Association (AHA) registered hospital listings. In comparing data from the National Vital Statistics Division with those published by the AHA, it should also be borne in mind that the surveys on which the AHA figures are based cover a reporting period from October 1 to September 30, whereas the data in this volume are for the calendar year.

Birth weight

In practically all areas, birth weight is reported in terms of pounds and ounces rather than in grams. However, the metric system has been used in tabulating and presenting the statistics to facilitate comparison with data published by other groups in the United States. The equivalents in pounds and ounces of the gram intervals are given in each table containing weight data.

For purposes of classification, the term "immature" is defined as referring to infants weighing 2,500 grams or less at birth. This definition was recommended by the American Academy of Pediatrics in 1935, and later adopted in the Sixth Revision of the International Lists of Diseases and Causes of Death (1948). "Premature," although containing the concept of duration of pregnancy, has also been used for many years in connection with the birth weight criterion. It is possible, however, that basic differences in physical development between different groups—for example, white and nonwhite infants—might make the weight criterion for immaturity too high or too low for a particular group.

The birth weights of infants born at home may not be measured as accurately as those of infants born in hospitals. Many of the attendants who weigh infants born at home use scales calibrated by quarter pounds. In addition, it is not known in such cases whether proper allowance is made for the diaper, blanket, or other material in which the infant is wrapped. Underregistration of small infants who die shortly after birth, or misreporting of them as fetal deaths, also affects birth weight statistics, and these factors are likely to be more important among infants born at home.

Median weights were, in effect, computed from data classified by pounds and ounces, then converted to grams, and rounded for publication. To establish the continuity of class intervals needed to compute medians, the end points of these intervals were assumed to be ½ ounce less at the lower end and ½ ounce more at the upper end. For example, "2 lb. 4 oz. to 3 lb. 4 oz." is interpreted as 2 lb. 3½ oz. to 3 lb. 4½ oz.

Period of gestation

An examination of the reported information on period of gestation suggests a substantial heaping at the interval "40 weeks and over." This bias probably results from the fact that gestation period is not carefully observed, and instead the newborn infant of normal size is assumed to have a gestation period of 40 weeks. Such errors in reporting are minimized in areas where the birth certificate asks for the date of the last normal menstrual period. Places using this question are California, Baltimore City, the District of Columbia, and New York City.

The following comparison of the percentage distributions of births in 1960 by length of gestation for the United States

[11] See footnote 10.

[12] For detailed reports on data for illegitimate births, see "Illegitimate Births: United States, 1938-57," by Joseph Schachter and Mary McCarthy, National Office of Vital Statistics, *Vital Statistics—Special Reports*, Vol. 47, No. 8, 1960; and "Deterrents to Early Prenatal Care and Social Services Among Women Pregnant Out of Wedlock," by Blanche Bernstein and Mignon Sauber, New York State Department of Social Welfare, Albany, New York, December 1960.

as a whole and for California and the District of Columbia combined suggests the magnitude of the distortion:

PERIOD OF GESTATION	1960		1950	
	United States	Calif. and D.C.[1]	United States	Calif. and D.C.[1]
TOTAL	100.0	100.0	100.0	100.0
Under 36 weeks	3.8	6.3	3.5	3.4
36 weeks	3.3	3.2	7.6	4.3
37-39 weeks	15.9	41.0	8.5	9.2
40 weeks and over	76.9	49.6	80.4	83.0

[1]By place of residence. Data include a very small number of records for events occurring outside these areas.

The likelihood that these differences are factitious is suggested by the comparison of 1950 data. In that year California and the District of Columbia had not yet adopted the more precise form of the gestation item. The similarity of distributions at that time is apparent.

In former years there was also some heaping at the 36-week interval, and for this reason the class intervals of periods of gestation were established to show the 36-week period separately. The 1950 data for the United States show that 7.6 percent of the births were reported as of this gestation; in 1960 the percentage was only 3.3. While these figures are not in themselves conclusive, they suggest that improvement in reporting has occurred.

In terms of gestation age, "premature" relates to pregnancies of less than 37 completed weeks. The method of reporting gestation age is probably of considerable importance in the relative number of prematures shown by these data. Evidence to this effect is observed in comparing the rates for California and the District of Columbia combined with that for the United States. In 1960 for the country as a whole, there were 6.3 percent of the white infants and 11.5 percent of the nonwhite whose gestation period was less than 37 weeks; the corresponding figures for California and the District of Columbia were higher—8.4 percent and 15.9 percent.

Control of errors

The coding and punching of birth data were performed simultaneously and the major portion of the work verified using a partial sequential sample. This procedure was used in verifying the work of employees whose performance (as indicated by complete verification) was such as to produce consistently less than 4-percent error distributed among all the items. For any one item, less than 1-percent error would be expected under these procedures. The procedure involved the verification of the coding and punching of every 10th card throughout each lot of 2,000 cards. If the 4-percent level of error (8 cards containing one or more incorrectly coded or punched columns) was reached, each succeeding card in the lot was verified. In such lots no review was made of that portion preceding the 8th error card. The work of trainees whose performance was such as to produce more than 4-percent error was verified completely. Errors determined in either procedure were reviewed to detect and control bias.

Tabulating, computing, table preparation, and all other operations subsequent to the preparation of punched cards were verified.

INTERPRETATION OF DATA

While vital statistics data are useful for a variety of administrative and scientific purposes, they cannot be correctly interpreted unless various qualifying factors, in addition to methods of classification, are taken into account. The factors to be considered depend upon the specific purposes for which the data are to be used. It is not feasible to discuss all of the pertinent factors in the use of vital statistics tabulations, but some of the more important should be mentioned.

Most of the factors limiting the use of the data arise from imperfections in the original records or from the impracticability of tabulating these data in very detailed categories. These defects should not be ignored, but their existence does not vitiate the value of the data for most general purposes. Analysis of small differences or exact evaluation of vital statistics requires careful study of many related elements. However, the major trends and differences will not usually be changed materially by finer analysis.

Sampling of birth records

Final birth data for 1951-54 and 1956-60 have been derived from 50-percent samples which consist of only even-numbered birth records.[13] Statistics for these years were obtained by multiplying the sample figures by 2. Prior to 1951 and for 1955, annual birth statistics were based on the total file of birth records.

The sample data represent estimates which differ somewhat from figures that would have been derived by processing all the records. However, the manner in which records are numbered greatly reduces the sampling variability of totals for geographic areas. With few exceptions, records are numbered in the State offices of vital statistics as they are received from the local offices. The assignment of the last digit in the number is not selective, and the systematic sample of even-numbered records may be assumed to be unbiased. Furthermore, because the records are almost always in geographic order before numbering, twice the sample count of births occurring in the great majority of counties in table 3-1 (Section 3) is virtually the same as the corresponding figure based on all records.

The extent to which residence figures for urban places, counties, and States derived from the sample differ from

[13]This applies to data for all States, the District of Columbia, and Puerto Rico. Data for the Virgin Islands are based on all of the records filed.

the totals that would have resulted from a complete count depends on the amount of nonresident interchange. (This assumes virtually no error in the figures on a place-of-occurrence basis.) Since there is relatively little nonresident interchange of births among the States and between "metropolitan" and "nonmetropolitan" groups of counties in any State, the sampling errors for these geographic units are negligible.

The nonresident interchange factor is more important for many individual urban places and counties. During 1960, 16 percent of the births occurred in a county which was not the mother's place of residence. Figures are not shown in this volume on the amount of nonresident interchange in individual counties. But, the net situation for a county can be determined by comparing the figures by place of occurrence and by place of residence in table 3-1. The percent error in a county resident total due to sampling varies between zero and the value obtained from the table described below; the amount of the error depends on the extent of nonresident interchange as judged from this comparison.

The following table shows percent errors due to sampling in the published birth data by other than geographic characteristics. The chances are about 2 out of 3 that the percent difference due to sampling variability between the published figure based on the 50-percent sample and the result that would be obtained by a complete count is less than the appropriate percent error shown in the table. The chances are about 19 out of 20 that the percent difference is less than twice the percent error.

NUMBER OF BIRTHS WITH A SPECIFIED CHARACTERISTIC	TOTAL BIRTHS IN AREA OR TO RESIDENTS OF AREA[1]							
	250	500	1,000	2,000	5,000	10,000	50,000	500,000
30	18.3	18.3	18.3	18.3	18.3	18.3	18.3	18.3
50	14.1	14.1	14.1	14.1	14.1	14.1	14.1	14.1

50,000	...	...	...	...	...	...	0.0	0.4

[1]An "area" is the smallest geographic unit to which the figure under consideration pertains. If the area is a city or county of residence where appreciable nonresident interchange occurs, the sampling error will be slightly larger.

Completeness of registration

Although every State has adopted a law requiring the registration of births, deaths, and fetal deaths, these laws are not uniformly observed. In most areas practically all births and deaths are registered. For some areas, however, there is enough underregistration to affect the use of the statistics for certain purposes.

Nationwide tests of completeness of birth registration were made in both 1940 and 1950. For the United States as a whole, these tests indicated that birth registration was respectively 92.5 and 97.9 percent complete. A detailed discussion of the results of these tests was given in chapter 6 in Volume I of *Vital Statistics of the United States, 1950.* On the basis of results of the 1950 test, it is estimated that in 1960 birth registration completeness was 98.9 percent for the country as a whole—99.3 for the white group and 96.4 for the nonwhite. (See table 1-P and figure 1-1 in Section 1.)

Discontinuation of adjustment for underregistration

Several factors were considered in making the decision to discontinue adjustments for underregistration of births beginning in 1960.

In the computation of birth rates, data from two independent sources have been interrelated: birth registration data for the numerator and census enumerated data for the denominator. Consequently, there is a potential bias in the resultant rate to the extent that there are differences between the two sets of the data with regard to the completeness of the overall counts and in the accuracy of reporting of pertinent items for which the rate is specific. A method of assessing this bias involves the measurement of error in each of the two sets of data and correction for this error before the rates are computed. The resultant rates can then be regarded as "true rates" and can be compared with published rates.

This approach has been used in preparing the figures below. Estimates of population data prepared by Dr. Ansley Coale show population figures corrected for biases in age reporting and census undercounts.[14] Estimates of births corrected for underregistration are also available. (While measurements of misstatements of age of mother on the birth record have not been developed, biases of this kind are believed to be relatively small in the registration data.)

Rates in the first column of the table on page 5-9 are computed from the two sets of data. The rates in the second column are those routinely published by this office, i.e., the numerator is adjusted for underregistration and the denominator is unadjusted. The rates in the third column are computed entirely from unadjusted figures. It will be observed that the latter figures provide a closer approximation of the "true rates" than those partially adjusted. This suggests that biases of approximately the same magnitude and direction exist in both the 1950 census figures and the 1950 National Vital Statistics Division birth data. It is probable that a very similar relationship exists between the birth and population data for at least the entire 1950-60 period.

Moreover, as birth registration becomes more nearly complete, as indicated by the estimates, the effect of adjustment becomes smaller and smaller. In 1960 the estimated registration completeness was 99.3 percent for the white group and 96.4 percent for the nonwhite.

Also pertinent to the question of continuing the adjusted series is the fact that about 10 years have elapsed since the last test of birth registration completeness in 1950. The results of this test form the basis for all adjustments

[2]Rates computed by relating births to mothers aged 45 years and over to female population aged 45-49 years.

in the subsequent years. These adjustments are generally made by assuming that registration completeness by occurrence in- and not-in-hospital, by color and by State, is the same for the year in question as in 1950. In effect, the estimated change in registration comes about from the increasing utilization of hospital facilities for obstetrical services. The difficulty is that the underlying assumptions become more tenuous as we move further away from the benchmark year. It is not known to what extent the basic coefficients of registration completeness have changed over time.

A practical difficulty is encountered in presenting an analysis of the data when they are in the form of adjusted numbers and rates through 1959 and registered thereafter. This change results in a discontinuity—not always trivial—of the time series. In the case of the nonwhite group, under-registration is still estimated at almost 4 percent. When making comparisons of the birth rates for nonwhites over the past decade, a more accurate indication of change might be obtained by using all figures adjusted or all figures unadjusted. The situation is similar for a number of States where registration completeness is relatively low. (See table 1-AB, Section 1, which shows the 1959 adjusted and unadjusted birth rates by State.)

Also, for certain purposes when number of births rather than birth rates is being used (e.g., in making population projections or net migration estimates), it would be preferable to use adjusted data, particularly for geographic areas where a significant number of births are unregistered.

Population bases

Unless noted otherwise, vital rates shown in this report for the United States are based on the resident populations of the respective areas. These populations exclude the Armed Forces and civilian personnel out of the country but include the Armed Forces stationed in each area and foreign residents present in the area. All populations for 1960 are those shown by the 1960 population census, taken as of April 1, 1960, except for table 5-2, which includes the estimated number of Armed Forces and civilians abroad. Tables 5-3 and 5-4 give the latest available estimates for the 1950-60 decade by age, sex, and color for the United States and the total population for each State, respectively. These estimates are based on information from the 1960 and 1950 censuses and data on births, deaths, civilian migration, and movement into and out of the Armed Forces. Tables 5-5, 5-6, and 5-7 give certain population data from the 1960 census which are needed for computation of certain vital rates and are not readily available in this form elsewhere.

All population data shown or used in this report were provided by the Bureau of the Census, unless otherwise noted.

Residence allocation

Tests made in 1950 indicate that for the country as a whole, errors in residence reporting result in a significant overstatement of births to residents of urban places and a corresponding understatement in the number to residents of areas classified as rural. The extent of bias varies from State to State and from city to city in the same State. Residence errors occur largely because of the major growth in population areas close to cities. Frequently, parts of these surrounding areas have city mailing addresses, and unless special care is taken in asking for residence information, they could be identified as being inside the cities. This situation has assumed special importance because of a concomitant development, the increased utilization of hospitals in cities by residents of nearby places. Misstatements of residence are more likely to remain undetected in such cases than when the birth occurs in the place of residence.

Item 2 on the standard certificate of live birth is "Usual Residence of Mother." In addition to asking for State, county, city, town, or location, and street address,

the standard certificate forms include the questions "Is residence inside city limits?" and "Is residence on a farm?" Table 5-A shows the States which include these questions on their certificates. There is some evidence that use of the first question has improved the accuracy of residence reporting, but the degree of improvement is not known. For a variety of reasons, the information entered in item 2 does not always permit an accurate decision as to the proper allocation of residence.

In some cases, the place named in item 2c (City, town, or location) is actually a subdivision of a city. If the place named does not appear in the geographic code manual as a separate place, allocation is made to the "balance of county" unless there is some other information available to the coder. In some cases, the additional information consists of a residence code entered by the local registrar or in the State vital statistics office. In other cases, lists of place names which are actually inclusions of listed cities are furnished by the State offices. It is probable, however, that a number of certificates filled out in this manner are incorrectly coded for residence, either because additional information is not available or because information on hand is outdated. City boundaries might change, for example, without either the State vital statistics office or the National Vital Statistics Division being notified.

Many people receive their mail in a geographic subdivision other than that in which they live and, when asked for their address, give their correct mailing address. Proper use of the check box in item 2e (Is residence inside city limits?) will prevent allocation to the city named in 2c but does not necessarily assure correct allocation. Locally assigned residence codes, when they appear, provide the best means of avoiding error in these cases. However, a certain amount of error undoubtedly occurs affecting the accuracy of data for cities and to some extent, counties.

Table 5-3. Total Resident Population, by Age, Color, and Sex: United States, 1950-60—Continued

(Alaska included beginning 1959, and Hawaii, 1960. Figures include Armed Forces stationed in the United States but exclude those stationed outside the United States. All figures, except census counts, are rounded to the nearest thousand without being adjusted to totals which are independently rounded)

AGE, COLOR, AND SEX	Enumerated as of April 1, 1960	ESTIMATED AS OF JULY 1									Enumerated as of April 1, 1950

[1]The population estimates for 1951-59 shown in this table were the latest available at the time this report was prepared. The estimates of population for all ages for 1951-59 were made at an earlier date. Therefore, the figures by age, color, and sex shown in this table do not add to totals for all ages. Estimates by age for the period 1951-59, based on both enumerations were not available at the time birth rates and other relative numbers based on births and population were computed. In Section 1 of this report, Natality—General Summary, estimates by age based on the 1950 census only were used; see Nos. 121, 170, 193, and 212 of Current Population Reports, cited in the source below.

Source: U.S. Bureau of the Census, "Estimates of the Population of the United States and Components of Change: 1940 to 1960," Current Population Reports, Series P-25, No. 223; provisional estimates by age, color, and sex for 1951-59, to be published in the above series; U.S. Census of Population: 1960, General Population Characteristics, United States Summary, Final Report, PC(1)-1B. Washington, U.S. Government Printing Office, 1961.

Table 5-4. Total Resident Population: United States, Each Division and State, Puerto Rico and Virgin Islands, 1950-60

(Figures include members of the Armed Forces stationed in each State and exclude members of the Armed Forces stationed abroad. All figures, except for census counts, are rounded to the nearest thousand without being adjusted to totals which are independently rounded)

Section 6. Subject Index

SECTION 6. SUBJECT INDEX

The various subjects covered in the text portions of Volume I and the principal variables of the tables and charts are listed in this index. For a comprehensive listing of the contents of the individual tables, the index refers the reader to the "Guide to Tables" for Sections 1 through 5. These show the specific variables covered in each table, the geographic coverage, and the type of entry (frequencies, rates, ratios, and percentages). Specific cross-classifications are not shown in the "Guide to Tables."

The page numbers of the volume are two-part numbers separated by hyphens; the first part refers to the section and the second refers to the page within the section; for example, 1-15 means page 15 of Section 1.

Age of father
- Birth rate table, *see* guide to Section 1
- Frequency tables, *see* guide to Section 2
- Birth rates, 1-8
- Color, 1-8
- Errors in response and reporting, 5-5
- Fertility, 1-8

Age of mother
- Birth rate tables, *see* guide to Section 1
- Fertility rate tables, *see* guide to Section 1
- Frequency tables, *see* guides to Sections 1 and 2
- Birth rates, 1-5ff., 1-7f., 1-14; (Fig. 1-6) 1-6
- Color 1-7, 1-9, 1-11, 1-14
- Completeness of birth registration, 5-5
- Errors in response and reporting, 5-5
- Fertility, 1-6, 1-14
- Illegitimacy, 1-13
- Immature births, 1-14
- Live-birth order, 1-5ff., 1-9; 5-5
- Mature births, 1-14
- Parity, 1-7f.
- Plural births, 1-11
- Sex ratio, 1-9
- Trends, (Fig. 1-6) 1-6
- Weight at birth, 1-14

Age-sex-adjusted birth rates
- Birth rate table, *see* guide to Section 1
- Color, 1-3; (Fig. 1-3) 1-3
- Trends, 1-3; (Fig. 1-3) 1-3

Attendant at birth
- Frequency tables, *see* guides to Sections 1 and 3
- Percentage tables, *see* guide to Section 1
- Classification scheme, 5-6
- Color 1-11f.; (Fig. 1-9) 1-12
- Distribution of live births, 1-12; (Fig. 1-9) 1-12
- States, 1-12
- Trends, 1-11f.; (Fig. 1-9) 1-12

Birth indices, monthly, 1-10f.

Birth probabilities
- Birth probability table, *see* guide to Section 1

Birth rates, *see* Fertility
- Birth rate tables, *see* guide to Section 1
- Fertility rate tables, *see* guide to Section 1
- Adjusted for underregistration, 1-2; 5-8ff.; (Fig. 1-2) 1-2, (Fig. 1-5) 1-5, (Fig. 1-6) 1-6, (Fig. 1-7) 1-6, (Fig. 1-8) 1-10
- Age of father, 1-8
- Age of mother, 1-5ff., 1-7f., 1-14; (Fig. 1-6) 1-6
- Age-sex-adjusted, 1-3; (Fig. 1-3) 1-3
- Birth indices, 1-10f.
- Color, 1-3, 1-7, 1-8; (Fig. 1-3) 1-3
- Geographic divisions, 1-14, 1-15
- Illegitimacy, 1-13
- Live-birth order, 1-5ff.; (Fig. 1-5) 1-5, (Fig. 1-7) 1-6
- Metropolitan and nonmetropolitan counties, 1-15
- Month of birth, 1-10f.; (Fig. 1-8) 1-10
- Native white women, (Fig. 1-5) 1-5
- Parity, 1-7f.
- Race, 1-9f.
- Rate of natural increase, 1-1
- Seasonal variation, adjusted for, 1-10f.; (Fig. 1-8) 1-10
- Standard metropolitan statistical areas, 1-15
- States, 1-14
- Trends, 1-2f., 1-9f., 1-14, 1-15; (Fig. 1-2) 1-2, (Fig. 1-3) 1-3, (Fig. 1-5) 1-5, (Fig. 1-6) 1-6, (Fig. 1-7) 1-6, (Fig. 1-8) 1-10

Birth-registration area, 5-1, 5-4

Cities

FLOW OF VITAL RECORDS AND STATISTICS IN THE UNITED STATES

RESPONSIBLE PERSON OR AGENCY	BIRTH CERTIFICATE	DEATH CERTIFICATE	FETAL DEATH CERTIFICATE (Stillbirth)	NOTIFIABLE DISEASE REPORT	REPORTING OFFICIALS	MARRIAGE RECORD	DIVORCE OR ANNULMENT RECORD
Physician or Other Professional Attendant	Completes entire certificate in consultation with parent(s). Files certificate with local registrar of district in which birth occurs.	1. Completes medical certification and signs certificate. 2. Returns certificate to funeral director.	Certifies to the cause of fetal death and signs certificate. Returns it to funeral director.	Reports each case by telephone or by mail on special form to local or state health department.	Clerk of Local Government	1. Receives application for marriage license. 2. Verifies information from serological tests. 3. Issues marriage license. 4. Sends completed record of marriage to State registrar.	
Funeral Director		1. Obtains personal facts about the deceased. 2. Takes certificate to physician for medical certification. 3. Delivers completed certificate to local registrar and obtains burial permit.	1. Obtains facts about the fetal death. 2. Takes certificate to physician for entry of causes of fetal death. 3. Delivers completed certificate to local registrar and obtains burial permit.		Marriage Officiant	1. Performs the marriage ceremony. 2. Certifies to facts of marriage and sends the record to license clerk.	
Local Registrar of Vital Statistics	Verifies completeness and accuracy. Makes copy, ledger entry, or index for local use. Sends certificates to local health department or to State registrar.	1. Verifies completeness and accuracy. Makes copy, ledger entry, or index for local use. Sends certificates to local health department or to State registrar. 2. Issues burial permit to funeral director. 3. Verifies returns of burial permits.	1. Verifies completeness and accuracy. Makes copy, ledger entry, or index for local use. Sends certificates to local health department or to State registrar. 2. Issues burial permit to funeral director. 3. Verifies returns of burial permits.		Clerk of Court		1. Provides form for report to petitioner or attorney, or uses petition for decree to make entries on such form. 2. Verifies entries on returned form. 3. Enters final decree facts. 4. Sends completed report to State registrar.
City or County Health Department	1. Uses certificates in allocating medical and nursing services, follow up of infectious diseases, planning programs, and measuring effectiveness of activities. 2. Forwards certificates and case reports to State registrar.				Attorney for Petitioner		1. Enters personal facts relative to spouses. 2. Returns form to clerk of court.
State Health Department Bureau of Vital Statistics	1. Queries incomplete or inconsistent information. 2. Maintains files for permanent reference and source of certified copies. 3. Compiles statistics for State and civil divisions of State for use of the health department and other interested agencies or groups. 4. Prepares copies of birth, death, fetal death, marriage, and divorce certificates or records, and summary reports of notifiable diseases for transmission to the National Vital Statistics Division.						
Public Health Service National Vital Statistics Division	1. Prepares and publishes national statistics of births, deaths, fetal deaths, marriages, divorces, and notifiable diseases for official and voluntary consumers. 2. Publishes analyses of data as they relate to public health and social problems. 3. Provides services needed to foster more complete and uniform registration.						

NOTE.—In some States certificates of birth, death, and fetal death and reports of notifiable diseases are not routed through local health departments; in others, there is no central file for marriage and divorce records at the State level.
