VITAL STATISTICS OF THE UNITED STATES
PART II. GEOGRAPHIC CLASSIFICATION BY PLACE OF RESIDENCE

Introduction

This volume—Vital Statistics of the United States, Part II—contains additional official statistical tabulations of natality and mortality data for the calendar year 1937. In Part II, the tables consist of tabulations of births and deaths classified according to the place of residence of the mother of the child, or the place of residence of the decedent; tabulations comparing these data with data classified by place of occurrence; and tabulations by related subjects such as hospital or institutional births and deaths. These tabulations are compiled from the same source material as the tables published in Part I, both being derived from transcripts of original birth and death certificates received from registration officials of States, cities, and outlying possessions of the United States.

This volume was prepared under the direction of Dr. Halbert L. Dunn, Chief Statistician for Vital Statistics, and Dr. John Collinson, Assistant Chief Statistician for Vital Statistics. The tabulations and introductory material were prepared under the immediate supervision of Dr. Forrest E. Linder, Social Science Analyst.

REVISION OF ANNUAL VOLUMES

Prior to 1937, vital statistics data compiled by the Bureau of the Census were published annually in two volumes—"Birth, Stillbirth, and Infant Mortality Statistics" and "Mortality Statistics." In 1937, these two volumes are combined in a single report entitled "Vital Statistics of the United States" and issued in two parts—Part I, consisting of tables classified by place of birth or death as in previous publications and Part II, consisting of new tables classified by place of residence.

The tables given in Part II should be interpreted with some caution since several factors enter into the determination of the place of residence. The place of birth or death, in most cases, is clear-cut and definitely determinable. The place of residence is much more difficult to determine and is dependent upon the definitions of residence and the completeness of the information given on the certificate. It has therefore been necessary to adopt a set of arbitrary rules which indicate the proper coding in each instance. The data obtained by a reallocation of nonresidents is obviously dependent upon these rules and cannot be correctly interpreted unless the rules are exactly and clearly stated.

The publication of this combined volume of natality and mortality data and the emphasis placed on tabulations by place of residence mark an important change in the compilations of vital statistics data made by the Bureau of the Census. In succeeding years, more of the tabulations will be made on a place-of-residence basis and the published residence tables will be expanded and revised. Some of the tables are considered of basic importance and these will be continued in comparable form for a period of years. Other tables are of only temporary value in clarifying the nature of the nonresident problem or in the analysis of the effect of reallocation of births and deaths to place of residence. Such tables will either be omitted from future reports or will be revised as seems desirable.

THE VALUE OF VITAL STATISTICS TABULATED BY PLACE OF RESIDENCE

Tabulated vital statistics may be used for many purposes, each requiring data classified by different groupings or according to different definitions. Many of these uses relate to public health work, such as an assay of the problems confronting public health agencies or the measurement of the results of public health programs. Other uses relate to maternal and infant welfare activities, problems of population research, actuarial investigations, medical research, et cetera. For some purposes, such as a study of the hospital load carried by a given community, the proportion of births attended by physicians, or the simple ranking of causes of death, it is possible to use tabulated natality and mortality data without relating them to other statistical data. But for the most part, vital statistics take on their full value only when related to population figures by the computation of birth or death rates. For deaths, these rates, in their simplest form, consist of ratios of the number of deaths occurring in a specified place during a specified time to the number of persons exposed to the risk of death at that place and time. It is obvious that such a rate can be correctly computed and interpreted only when the population figure in the denominator and the mortality figure in the numerator are compiled on a comparable basis. In other words, the population figures must represent a certain group which is exposed to the risk of death and the death figure must include all of this group which died. Although the birth rate is interpreted in a different manner, similar considerations apply to it.

For the United States, as a unit, there is little difficulty in securing adequate comparability between vital statistics and population figures. For individual cities or counties or for population-size groups, there are several disturbing factors. The population census is compiled on a de jure geographic basis. That is, each person is counted as a part of the population of that geographic unit in which he has his "usual place of abode." The enumerated population of a city is a count of all the persons who usually live in that city, excluding persons who are temporarily in the city at the time of the census and including residents of the city who are at some other place during the time of the census enumeration.

The crude death rate for the residents of any area must be based on the total resident population of that area and the total number of deaths occurring to this total resident population. It is essential to include the deaths of residents no matter where the death occurred, and to exclude deaths of nonresidents occurring in the area.

The occurrence of a large number of births and deaths "away from home" results from the mobility of the American people facilitated by convenient and unrestricted methods of transportation and from increasing use of hospitals for confinements or in cases of serious illness. Seasonal movements to and from resort States, seasonal migration in search of employment, the movement of people to some other area to take advantage of hospital facilities not available in their usual place of residence, are several of the factors which contribute to the number of nonresident births and deaths.

Inasmuch as the registration laws of each State specify that births and deaths be registered at the place of birth or death, the compilation of vital statistics on a de facto geographic basis—that is, according to place of occurrence—is the most direct and usual method. Rates computed on this basis may be called <u>recorded</u> rates, since all the births or deaths recorded in each area are included in the computation. The compilation of natality and mortality data on a de jure geographic basis requires a complete reallocation to the place of residence. When this reallocation has been made it is then possible to compute <u>resident</u> rates. Such resident rates, since they are the ratio of the number of deaths to the number exposed to the risk of death, are more descriptive of the force of mortality affecting a given population and can therefore be interpreted in terms of relative health conditions. Of course,

in such interpretations cognizance must be taken of other factors, such as the age distributions of the exposed populations.

From some points of view, it may seem incorrect to allocate deaths purely on a place-of-residence basis without taking account of the city or county responsible for the causes resulting in death. For example, a resident of one city may be killed in an automobile accident in another city. In such a case it may seem unreasonable to allocate that death to the city of residence if the accident was caused by traffic hazards in the city where the death occurred. However, even if desirable, the reallocation of deaths to the area responsible for the causes resulting in death would be a highly speculative and difficult task. Furthermore, admitting the possibility of making such an assignment of deaths, it then becomes necessary to devise an "exposed-to-risk" figure quite different from an enumerated population.

Tabulations of vital statistics by place of occurrence are valuable and necessary for certain purposes. Tabulations by place of residence and the computation of resident birth and death rates provide data of greater value and meaning for many uses. However, resident data cannot be directly interpreted for every purpose. No single method of tabulation could be devised which would provide statistics compiled in the manner necessary for all possible problems.

PREVIOUS TABULATIONS BY PLACE OF RESIDENCE

The first mortality transcript, used in 1900, contained a section for "special information" regarding place of residence, and successive volumes of mortality statistics discussed the importance of tabulating deaths by place of residence.[1] In spite of the early recognition of the importance of residence tabulations, no tables of this kind were made until 1914. This first nonresident table is described as follows in Mortality Statistics, 1914, p. 19: "The death rates given in this report are based, as heretofore, in accordance with Rule of Statistical Practice No. 11,[2] adopted by the American Public Health Association in 1908, on the inclusion of all deaths, of both residents and nonresidents, which occur in each area; but in addition there is presented a table (table I B, p. 42), showing, for each registration city and rural unit, the number of deaths and death rates, both inclusive and exclusive of nonresident deaths."

The table published in the 1914 volume was not based on a reallocation of decedents to place of residence but consisted merely of a separation for each area of the nonresident deaths from the total deaths. This separation was based on the following provisional definition of a nonresident: "A person who dies in a hospital or other institution and whose previous residence is given on the death certificate as other than in the registration district in which death occurred." Two things should be noted about this original definition. The definition referred only to persons dying in hospitals or other institutions and presumably all persons not dying in hospitals or institutions were considered residents of the place of death, even if some other place of residence was stated. Furthermore, this definition included no time limit and for this reason it was believed that "many decedents were excluded as nonresidents who in fact were properly residents of the registration district in which they died."[3]

In 1915, the definition of a nonresident was revised to include a time limit and all persons living more than 1 year in the place of death were defined as residents of that place. Upon application of this rule it was found that information on time of stay in the community was so poorly reported on the transcript that the validity of the resulting tabulations was considered doubtful. As a result, nonresident tables for 1915 were not published.

Because the information on place of residence and length of stay was so incomplete, a special drive was begun in 1916 to improve the basic data given on the death certificate. By 1918, it was believed that sufficient progress had been made to resume the publication of nonresident data.

In 1918, the definition of nonresidents was extended to include decedents other than those in hospitals and institutions, and a more extensive and detailed set of rules and decisions regulating the allocation of nonresident deaths was formulated. These rules are given in Mortality Statistics, 1918, pp. 14 and 15. On the basis of these rules and definitions a table was compiled which gave for each city and county in the death-registration area the following data: (1) number of deaths including nonresidents, (2) number of deaths excluding transferable nonresidents, (3) number of deaths excluding transferable nonresidents and including residents who died elsewhere in the registration area, (4) number of deaths of nonresidents not transferable. The distinction between transferable and nontransferable nonresidents was made because a decedent in the registration area whose place of residence was outside the registration area could not be reallocated to his place of residence. Similarly, deaths of residents of the registration area could not be included in the figures for this area, if the deaths had occurred outside the registration area.

Tables showing the number of deaths allocated to the place of residence were published for each year until 1928. These tables were similar to the table for 1918. For some years the tabulations included death rates, as well as the number of deaths, by place of residence and place of death. For the years 1923 to 1927, the tables were condensed by omitting the number of nonresident deaths for each area and showing only the number of recorded deaths and the number of resident deaths. The mortality report for 1928 contains no reference to the subject of nonresidents and no tables pertaining to this subject are given for that year. However, the volume for 1929 includes residence data for both 1928 and 1929. Comparable tables were also published in the volume for 1930.

For the whole period from 1918 to 1930 the rules were essentially unchanged, and the definitions of nonresident and the rules for reallocation were designed to make the mortality tabulations as consistent as possible with the enumerated population statistics.

In 1931, the tabulation of nonresident deaths was discontinued as an economy measure and for the years 1931 to 1934 no data on this important subject are available.

The completion of the registration areas in 1933 made possible, for the first time, a Nation-wide reallocation of nonresidents to the place of residence, and when nonresident reallocation was resumed in 1935, the definition of a nonresident was revised; more detailed rules for allocation were formulated; and compilation by place of residence was extended to birth statistics. Previous to 1935, no reallocation of births to place of residence of the mother of the child had been made. Plans formulated at this time envisage a gradual development and extension of natality and mortality tabulations by place of residence. Eventually, most of the major tabulations for individual cities and counties and for the population-size groups will be transferred to this basis.

Resident tabulations for 1935 and 1936 have not been published in the annual volumes—"Birth, Stillbirth, and Infant Mortality Statistics" or "Mortality Statistics"—but have been released in the series of "Vital Statistics—Special Reports." A list of these reports pertaining to resident tabulations is given below.[4]

1/ Mortality Statistics, 1900-04, p. XVI; 1910, p. 9; 1912, p. 13; et cetera.

2/ Rule of Statistical Practice No. 11 reads, "All deaths of transients or nonresidents occurring in a State or city should be included in the tables of total deaths."

3/ Mortality Statistics, 1914, p. 20.

4/ Births, deaths, and resident data for counties, and cities of 10,000 or more: 1935, vol. 2, Nos. 2-50, table V.

The interchange of birth and death nonresident transcripts between States, vol. 3, No. 37.

Number of births and deaths according to place of residence in each State: 1935, vol. 3, No. 40.

Number of recorded and residence-allocated births for cities of 100,000 or more in 1930: 1935, vol. 3, No. 43.

Number of recorded and residence-allocated deaths for cities of 100,000 or more in 1930: 1935, vol. 3, No. 44.

Number of births and deaths, and resident data for counties, and cities of 10,000 or more: 1936, vol. 4, Nos. 2-50, table W.

Number of births and deaths according to place of residence: 1935, vol. 4, Nos. 2-50, table X.

Deaths from cancer by place of residence: United States, 1935, vol. 5, No. 40.

Deaths from tuberculosis (all forms) by place of residence: United States, 1935, vol. 5, No. 48.

Number of births and deaths according to place of residence in each State: 1936, vol. 5, No. 49.

Maternal mortality by place of residence: United States, 1935, vol. 5, No. 50.

Number of births and deaths, and resident data for counties, and cities of 10,000 or more: 1937, vol. 6, Nos. 2-50, table W.

Number of births and deaths according to place of residence: 1936, vol. 6, Nos. 2-50, table X.

Number of births and deaths according to place of residence in each State: 1937, vol. 7, No. 37.

NONRESIDENT TABULATIONS BY STATE OFFICES

Because of the importance in public-health administration of vital statistics tabulations by place of residence, many State departments of health compile their data on this basis. A survey in 1935 showed that 11 States made rather complete residence reallocations and 8 States published tables showing the number of deaths for cities and counties including and excluding deaths of nonresidents. A more recent survey (1938) was made by a Committee on Residence Allocation under the auspices of the Vital Statistics Section of the American Public Health Association. This survey indicated that 24 States were making regular tabulations involving the allocation of nonresidents.

In most of these States the resident tabulations are based solely on a reallocation of nonresidents within the State. In other words, most States do not include in their tabulations, the deaths (or births) of residents of that State occurring in other States. For State totals, the allocation of interstate nonresidents is generally numerically unimportant. However, for areas near a State border, interstate reallocation may be very important since many deaths (or births) to residents of the area may occur in the adjacent State.

To assist the States in obtaining records of births or deaths of their residents in other States, the Vital Statistics Section of the American Public Health Association adopted, in 1931, a resolution requesting the Bureau of the Census to act as a clearing house in the exchange of such records. Since 1933, most States have sent to the Bureau of the Census, copies of birth and death certificates for out-of-State nonresidents and these have been forwarded to the State of residence. Although this interstate exchange has been of considerable value to the individual States it has not solved all of the difficulties met by State agencies in making a complete reallocation.

Differences of opinion exist regarding the principles on which the definition of a nonresident and the rules used in coding are based. For this reason the interstate transfer is not on a strictly uniform basis for all States. Some indication of the amount of variation among States can be seen in table A. In this table the number of nonresidents of each State according to the Bureau of the Census definitions is compared with those identified by the separate State offices. Table A shows for both births and deaths the number of nonresident transcripts to be subtracted from the tabulations of each State, and the number of resident transcripts to be added.

TABLE A.—FEDERAL AND STATE INTERCHANGE OF BIRTH AND DEATH NONRESIDENT TRANSCRIPTS BETWEEN STATES: 1937

AREA	BIRTHS						DEATHS					
	Nonresident transcripts to be subtracted			Resident transcripts to be added			Nonresident transcripts to be subtracted			Resident transcripts to be added

A study of the figures in this table, and particularly of the ratios between Federal and State figures, will indicate the existence of many differences in State procedures. While State tabulations fulfill an important need, it is obviously desirable for some central agency operating with a uniform although arbitrary set of rules, to make Nation-wide tabulations.

One other significant comment should be made regarding the differences between residence tabulations made by State agencies and those made by the Bureau of the Census. Because of the large number of transcripts involved in national tabulations, the coding rules used by the Bureau of the Census must be designed and simplified to facilitate mass production. Furthermore, the Bureau of the Census does not have access to the detailed local information necessary for certain types of allocation. For these reasons, it is not possible to introduce all possible coding refinements or to use different sets of rules for various causes of death. Many State offices, having special local problems or interests to meet, wish to use special coding rules for certain groups of data. For example, some States either allocate deaths in custodial institutions to the place of prior residence or consider these institutions as separate tabulation areas. Some States prefer to allocate deaths from infectious diseases to the area where the infection presumably originated, deaths from accidents to the place of accident, deaths from homicide to the place of homicide, et cetera.

The desirability of these special types of tabulation should be emphasized, but they often require detailed information available only in local offices and they involve operating rules feasible only for a relatively small volume of work. Therefore, while it is desirable for a central agency to make national tabulations, these national uniform tabulations do not replace those made by the separate State agencies.

DEFINITION OF NONRESIDENTS AND RULES FOR CODING

The reallocation of birth and death certificates to place of residence is based on information somewhat different, and collected in a manner different from that obtained in the enumerated population census. It is obviously not possible to use identical rules for both compilations. The tabulation of vital statistics on a place-of-residence basis requires that the information given on the certificate be interpreted in such a way as to result in classifications comparable to the census figures. The necessity for such interpretation introduces arbitrary and controversial factors into the procedure of allocation. It can hardly be expected that the de jure geographic classification can be as direct and simple as the de facto classification.

RELATION OF GEOGRAPHIC CODE TO THE IDENTIFICATION OF NONRESIDENTS.—Whether or not a person is classified as a nonresident depends somewhat upon the size of the area under consideration. A resident of Maine may die in California, yet this fact may be ignored when only totals for the United States are concerned. For State totals, only those persons who cross State lines need be considered in a reallocation of place of residence, since any movement within the State is irrelevant. On the other hand, for the study of mortality conditions within a city (for individual census tracts or wards), it is necessary to use a much finer definition of a nonresident. In such cases it may be necessary, for example, to define as a nonresident a person who lived on one side of a street and died in a hospital on the other side of the same street.

However the place of residence may be defined, the size of the tabulation or coding unit will partially determine the number of identified nonresidents. If the coding unit—assuming the use of a punch card system in which geographic areas are given numerical codes—is a whole county, then obviously it is impossible to determine, from a tabulation of the cards, the number of persons who moved about within the county. If the coding unit is a single registration district, it will be possible to identify persons moving from one district to another within the county, but it will not be possible to measure the movement within districts.

The tabulations given in this volume are based on a geographic code which identifies each city having a population of over 10,000 in 1930 and each county excluding these cities. The code for the county (exclusive of the cities of 10,000 or over) is subdivided into two codes, one for all incorporated places of 2,500 to 10,000 as a group, and another for all villages under 2,500 and rural areas as a group. It is important to note that, although the geographic code divides the county into these two parts, an exception is made in coding for residence, and a movement from one part of the county to another part of the same county is not identified.

Another limitation should be mentioned. If, for example, the nonresident deaths for each city and county within a State are tabulated, it is not possible to add these figures together and obtain the number of nonresidents of the whole State. Such addition will give the number of persons in the State who died in a tabulation-unit area other than the area of their residence, but will not give the number of nonresidents of the State, since a nonresident in a city may be a resident of some rural area or some other city in the same State. The term "nonresident" may have, therefore, one of two meanings. In reference to the smallest unit of tabulation (in this report, a city or county), a nonresident is a person who died within that unit but whose usual place of residence was in some other unit. In reference to a consolidation of separate geographic units (for example, a whole State), the term refers to the number of persons dying therein who are nonresidents of the particular place of death but are not necessarily nonresidents of the consolidated area. Furthermore, since the nonresidents of one area are necessarily residents of some other area, it is necessary to apply both terms to the same data when considered in different aspects. In order to avoid confusion, the tables given in this volume include headnotes or footnotes when additional clarification and explanation seem necessary.

RULES FOR THE ALLOCATION OF DEATHS.—The allocation of deaths to the place of residence is based on the following main rules:

1. General principle: Mortality data should be compiled so as to correspond with enumerated populations on which rates are to be based. Each death should be assigned to the area in which the decedent had his "usual place of abode."
2. With certain exceptions and qualifications, a decedent is defined as a nonresident if the place of residence stated on the certificate is different from the place of death.
3. Decedents who at the time of death had been living more than 1 year in a community are considered residents of that community even though some other place of residence is stated.
4. Decedents in general hospitals, tuberculosis sanatoriums, et cetera, are reallocated to the place of residence.
5. Decedents in mental institutions, et cetera, are not reallocated to the place of prior residence.

For the purpose of coding mortality transcripts, these rules have been expanded into definite coding instructions which state the procedure followed in each case. These coding instructions have been printed in the Official Instruction Manual of the Division of Vital Statistics and are reprinted below.

RULES FOR DETERMINING PLACE OF RESIDENCE FOR DEATHS.—Place of residence is coded in the same manner as place of death. The following statements define the meaning of residence:

1. In case no entry is made for place of residence, the decedent is coded as a resident of place of death.
2. If the place of residence is stated as unknown, the decedent is coded as a resident of the place of death.
3. If the residence is given as a foreign country, the decedent is coded as a resident of the place of death. In such instances, a copy is made of the transcript.
4. If the decedent is not in any institution and the residence is given as other than the place of death, and if the "length of stay" is less than 1 year, the place of residence as stated is coded. If the "length of stay" is not stated, place of residence as given is

coded. If the "length of stay" is more than 1 year, the decedent is coded as a resident of the place of death.

5. The inmates of penitentiaries; prisons; reformatories; hospitals for the insane, epileptic, and feebleminded; orphanages; and homes for the blind, the deaf, the indigent or aged, are considered as residents of the city, town, or county in which the institution is located, even when some other residence is stated. This rule applies regardless of the length of stay. This rule applies to inmates of institutions coded 8 or 9 for type of institution. (See p. 6 for code numbers.) This rule does not apply to employees of such institutions.

6. The inmates of surgical or medical hospitals, tuberculosis sanatoriums, and jails are usually only temporary inmates and are treated as nonresidents of the place of location of the institution if residence of some other city, town, or county is stated. This rule applies regardless of "length of stay." This rule applies to inmates of institutions coded numbers 1, 2, 3, 4, 5, 6, and 7, for type of institution.

7. In any case in which the decedent is stated as a nonresident and the coder is unable to determine the complete correct code for the stated place of residence, the decedent is coded as if he were a resident of the place of death.

8. Whenever "R. F. D." follows the place of residence, the place of residence is coded according to the county given on the transcript or the county in which the stated place of residence is located. If the place of residence is a city coextensive with a county, then consult the supervisor and query for additional information.

9. Whenever the place of residence is a city that is listed as a postal substation of another city and also as an individual city, the residence is coded according to the individual city.

10. Deaths are coded according to the place of residence of the deceased except in case of deaths of newborn infants. When infants are born at other than the place of residence of mother, and die before return to mother's residence, the residence of the mother is considered the residence of the child.

11. A transcript is a nonresident transcript only if the residence of the decedent is stated to be different than the place of death and if the geographic code for the place of residence differs in some respect from the geographic code for the place of death. In this connection the "geographic code" refers to State, city or county, set, and group numbers. According to this rule, if the residence is in one rural city and the death occurs in another rural city of the same county, the transcript is not a nonresident one. Exception: There is one exception to this rule. If the place of death is in a rural city and the residence is in the rural part of the same county (or vice versa), the transcript is a resident one even though the group number for place of death and residence is different.

RULES FOR THE ALLOCATION OF BIRTHS.—The allocation of births is made according to the same general principles as the allocation of deaths. In the case of births, however, the residence of the child is defined as the residence of the mother. The following rules have been used in coding place of residence for births.

RULES FOR DETERMINING PLACE OF RESIDENCE FOR BIRTHS.—Place of residence is coded in the same manner as place of birth. The following statements define the meaning of residence:

1. The residence of the mother is considered the residence of the child.

2. In case no entry is made for place of residence, the transcript is a resident transcript.

3. In case the place of residence is stated as unknown, the transcript is a resident transcript.

4. In case the place of residence is given as a foreign country, the transcript is a resident transcript.

5. In any case in which the place of residence is stated, but the coder is unable to determine the complete correct code for the stated place of residence, the transcript is a resident transcript.

6. Whenever "R. F. D." follows the place of residence, the place of residence is coded according to the county given on the transcript, or the county in which the stated place of residence is located.

7. Whenever the place of residence is a city that is listed as a postal substation of another city and also as an individual city, the code is given for the individual city.

8. A transcript is a nonresident transcript only if the residence of the mother (item 19) is stated to be different from the place of birth and if the geographic code for the mother's residence differs in some respect from the geographic code for the place of birth. In this instance, "The geographic code" refers to the State, city or county, set, and group numbers. According to this rule, if the residence of the mother is in one rural city and the birth occurs in another rural city of the same county, the transcript is not a nonresident one. Exception: There is one exception to this rule. If the place of birth is in a rural city and the place of residence is in the rural part of the same county (or vice versa) the transcript is a resident one even though the group number for the place of birth and the place of residence is different.

RELATION OF INSTITUTIONS TO NONRESIDENT CODING

An important feature of the rules used in coding nonresident transcripts for deaths is the distinction between two types of institutions. The first type of institution consists of surgical and medical hospitals and other institutions in which the length of stay is usually not long. These institutions are referred to as "nonresident institutions" since decedents here are considered as nonresidents of the place in which the institution is located, if residence in some other city, town, or county is stated. The second type consists of those institutions in which the length of stay is usually long and includes penitentiaries, hospitals for the insane, homes for the indigent and aged, et cetera. These institutions are referred to as "resident institutions" because decedents here are considered residents of the place in which the institution is located, even though some other place of residence may be stated on the death certificate.

The practice of the Bureau of the Census, in considering all decedents in "resident" institutions to be residents of the area in which the institution is located, is not consistent with the practice of some individual State agencies. Some States prefer to allocate these deaths to the place of prior residence. The reallocation of these deaths has the effect of reducing the total death rate of the areas which contain institutions since it is not always possible to distribute the population of the institution in a comparable manner before computing rates.

While the tabulations in this volume have been based on reallocation according to present usual place of abode, regardless of previous residence, it is desirable to have, for some purposes, mortality figures for cities and counties, exclusive of deaths in resident institutions. Table 9 gives, with other data on institutional deaths, the number of deaths in resident institutions for each geographic area. These figures may be subtracted from city and county "Total deaths of residents" given in table 1, to obtain the number of deaths of residents of each area exclusive of all deaths occurring in this type of institution.

Since only the name of the hospital or institution is given on the death certificate, it is not possible to determine directly the type of institution. To facilitate the work of coding, an institution code index has been developed which lists the name and type of each known institution. This institution index has been developed by the Bureau of the Census with the assistance and cooperation of the American Medical Association. While the primary purpose of the index is to classify institutions for the purpose of coding place of

residence, each institution is also classified according to "Type of institution (service)" and "Type of control." These classifications are consistent with those used by the American Medical Association in the list of registered hospitals published in the annual hospital number of the Journal of the American Medical Association.

The following outline shows the system of classifying institutions and gives an extended and abbreviated code symbol.

INSTITUTION CODE: TYPE OF INSTITUTION

NONRESIDENT INSTITUTIONS			NONRESIDENT INSTITUTIONS			RESIDENT INSTITUTIONS		
Extended code	Abbreviated code		Extended code	Abbreviated code		Extended code	Abbreviated code	
		General hospitals and combinations (except with resident institutions)	41	4	Tuberculosis and convalescent and rest	90	9	Other resident institutions
			42	4	Tuberculosis and isolation	91	9	Blind and deaf
00	C	General and cancer	43	4		92	9	Incurable
01	0		44	4	Tuberculosis and orthopedic	93	9	
02	0		45	4				Prisons, reformatories, and industrial homes (some are classified by the American Medical Association as institutional)
03	0	General and isolation	46	4				
04	0		47	4				
05	0	General and orthopedic	48	4	Other combinations (except with general)	94	9	
06	0	General and tuberculosis						
07	0		49	4	Unspecified	95	9	Homes for aged and poor, county homes, farms and infirmaries, homes for soldiers and sailors
08	0	General and other combinations						
09	0	General unspecified			Other types of hospitals of nonresident type			
			60	6		96	9	
		Children and maternal hospitals	61	6		97	9	Orphanages
10	1	Children	62	6		98	9	
11	1	Children and orthopedic	63	6		99	9	Miscellaneous (institutions)
12	1	Gynecology	64	6				
13	1	Gynecology and maternal	65	6				Government control
14	1		66	6				
15	1	Maternal	67	6	Unknown	00	0	Indian Affairs
16	1	Maternal and children	68	6	Other combinations of hospitals not otherwise listed	10	1	United States Army
17	1					11	1	United States Navy
18	1		69	6	Miscellaneous	20	2	Veterans' Administration
19	1	Miscellaneous				30	3	United States Public Health Service
					Other types of nonresident institutions other than hospitals	39	3	Other Federal agencies
		Hospitals for chronic and lingering illness	70	7	Institutions on nondescript list of the American Medical Association	40	4	State
20	2	Alcoholic				50	5	City
21	2	Drug				51	5	County
22	2	Cardiac	71	7	Institutions on unauthorized or unregistered list of the American Medical Association (not divided into resident and nonresident institutions)	52	5	City and county
23	2	Chronic				60	6	State and city
24	2	Cancer				61	6	State and county, State or county
25	2	Cancer and other combinations (except general and tuberculosis)				62	6	State, city, and county
26	2	Convalescent and rest	72	7				
27	2		73	7				Nonprofit control
28	2		74	7	Jails	70	7	Church
29	2	Miscellaneous	75	7		71	7	Fraternal
			76	7		72	7	Nonprofit associations
		Specialized hospitals	77	7				
30	3	Eye, ear, nose, and throat	78	7				Proprietary
31	3		79	7	Miscellaneous	80	8	Individual
32	3					81	8	Partnership
33	3	Isolation	RESIDENT INSTITUTIONS			82	8	Corporation
34	3	Isolation venereal, syphilis, and gonorrhea				83	8	Independent
35	3	Isolation miscellaneous types, smallpox, trachoma				84	8	Industrial
36	3					85	8	Association
37	3	Orthopedic, orthopedic and neurological			Insane institutions			Others and combinations of main types
			80	8	Epileptic	90	9	Government—Federal and local
38	3	Surgical and emergency, surgical and eye, ear, nose, and throat	81	8	Feeble-minded	91	9	Government—Federal with nonprofit
			82	8	Mental defective or mental			
			83	8	Neurological and mental or nervous and mental	92	9	Government—Federal with proprietary
39	3	Miscellaneous	84	8		93	9	Local with nonprofit
			85	8		94	9	Local with proprietary
			86	8		95	9	Nonprofit with proprietary
		Tuberculosis hospitals and sanatoriums	87	8				
			88	8		98	9	Unknown
40	4	Tuberculosis and cancer	89	8	Nervous, miscellaneous	99	9	Miscellaneous

DEATHS ALLOCATED TO PLACE OF RESIDENCE

SUMMARY FOR DEATHS.—In 1937 there were 1,450,427 deaths registered in the United States of which 179,874 (12.4 percent) were of nonresidents of the city or county in which death occurred. Considering the data only by broad population groups, most of these nonresident deaths (58.6 percent) were of persons moving to cities larger than their place of residence, but in 24.2 percent of the instances the movement has been from large cities to smaller cities or rural areas. Most of the nonresidents in any State are residents of some other part of the same State and do not, therefore, represent movement between States. In the United States there were 28,610 interstate nonresident deaths. These comprise 15.9 percent of all nonresident deaths and only 2.0 percent of all deaths.

A summary of the reallocation of deaths to place of residence is given in table B. This table shows the total number of deaths occurring in each State, the number of these which were of nonresidents, the number of deaths of residents occurring in other areas, and the number of deaths of residents wherever occurring. For example 30,843 deaths were recorded in Alabama in 1937. Of this total number of recorded deaths, 2,441 occurred in a city or county of which the decedent was not a resident. In 2,099 instances the decedent was a resident of some other area of Alabama and in 342 instances the decedent was a resident of some other State. Considering next the deaths of residents of Alabama, the table shows that 2,426 residents of Alabama died in some city or county other than their residence. Of these, 2,099 died in some other area of Alabama, and 327 Alabama residents died in some other State. Altogether, a total of 30,828 residents of Alabama died in 1937, irrespective of the place of death.

An inspection of table B shows relatively small differences between the total number of deaths occurring in a State and the total number of deaths of residents of the State. This indicates that the interstate nonresident deaths are a small proportion of the total deaths and that in most cases the number of residents leaving a State and dying in other States approximately balances the number of residents of other States

dying within the State. Even in States where a large number of out-of-State nonresidents is to be expected, reallocation does not greatly change the State totals. In Florida the difference between the number of recorded deaths and the number of resident deaths is 5.1 percent of the number of resident deaths; in New Mexico, 4.2 percent; in Arizona, 3.9 percent; and in California, only 1.5 percent. These figures demonstrate that in most cases for State totals it is unnecessary to reallocate deaths to the place of residence. It is only for individual areas within the State that reallocation is important. To obtain correct figures for areas near State borders, it is probably necessary that this reallocation be on an interstate as well as an intrastate basis.

TABLE B.—DEATHS OF NONRESIDENTS IN EACH STATE AND DEATHS OF RESIDENTS IN OTHER STATES: 1937

(Exclusive of stillbirths)

AREA	Total deaths in area	DEATHS						Total deaths of residents
		Of nonresidents in area			Of residents in other areas			
		Total	From same State	From other States	Total	In same State	In other States	
United States	1,450,427	179,874	151,264	28,610	179,874	151,264	28,610	1,450,427

NUMBER OF NONRESIDENT DEATHS.—The proportion of nonresident deaths for each State is given in table C. This table shows the total number of deaths occurring in each State and the number and percent of these which are of nonresidents of the particular area in which death occurred. For the entire United States the nonresident deaths constitute 12.4 percent of all deaths, but in individual States this proportion ranges from 1.8 percent in Mississippi to 23.5 percent in Nevada. A frequency distribution of States showing the percent of total recorded deaths which are of nonresidents is given in table D.

TABLE C.—DEATHS OF NONRESIDENTS AND PERCENT OF TOTAL RECORDED DEATHS: EACH STATE, 1937

(Exclusive of stillbirths)

AREA	Total deaths in area	DEATHS OF NONRESIDENTS IN AREA		AREA	Total deaths in area	DEATHS OF NONRESIDENTS IN AREA	
		Number	Percent of total			Number	Percent of total
Alabama	30,843	2,441	7.9	Nebraska	13,199	1,488	11.3

TABLE D.—FREQUENCY DISTRIBUTION OF STATES BY PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED DEATHS: 1937

(Exclusive of stillbirths)

PERCENT NONRESIDENTS	NUMBER OF STATES
0- 4	1
5- 9	10
10-14	23
15-19	11
20-24	4

Since the movement to cities for hospitalization in case of illness is an important contributing factor to the number of nonresident deaths, it is reasonable to suppose that the proportion of nonresident deaths will be greater in cities than in rural areas. A study of table E reveals several interesting features of the urban-rural distribution of nonresident deaths. The percent of nonresident deaths in rural areas and in very small cities (2,500 to 10,000) is definitely below the total for the United States. In cities of 10,000 to 25,000 the proportion of nonresident deaths is greater than for any of the other population groups shown in table E. For cities of this size as a group, over 22 percent of all deaths occurring in these cities are of residents of some area other than the place of death. Large cities have about the same proportion of nonresident deaths as the entire country. For cities of 100,000 or more 12.3 percent of all decedents are nonresidents.

TABLE E.—PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED DEATHS BY POPULATION GROUPS: 1937

(Exclusive of stillbirths)

POPULATION GROUP	PERCENT NONRESIDENTS
United States	12.4
Cities of 100,000 or more	12.3
Cities of 25,000 to 100,000	20.3
Cities of 10,000 to 25,000	22.2
Cities of 2,500 to 10,000	9.9
Rural	8.2

The number and proportion of nonresident deaths for individual cities having populations of 100,000 or more are given in table F. Small proportions of nonresidents are noted for Chicago (4.2 percent) and Philadelphia (4.8 percent). Cities having a large proportion of nonresident deaths are Camden, New Jersey (30.3 percent); Salt Lake City, Utah (25.7 percent); Hartford, Connecticut (24.8 percent); and Memphis, Tennessee (24.6 percent). A frequency distribution of cities showing the variation of the percent of nonresident deaths is given in table G. Nineteen cities have less than 10 percent nonresident deaths, and 60 cities have between 10 and 20 percent.

CHANGES IN DEATH STATISTICS FOR POPULATION-SIZE GROUPS.—The effect of the reallocation of deaths to place of residence upon data classified by population-size groups is shown in table H. This table shows the complete reallocation from place of death to place of residence for these groups. The designations in the table stub refer to the place of death, and reading horizontally in rows, the table gives the total number of deaths occurring in each population group, the number of these that were of residents of the place of death, and the number which were of nonresidents. The nonresidents are subdivided according to their place of residence. Reading vertically, the table gives the total number of deaths of residents of each population group. This number is divided into deaths of residents who died at the place of residence and of residents dying elsewhere. The deaths of residents dying elsewhere are classified according to the area in which death occurred.

The structure of this table may be clarified by an illustration. In cities having populations of 100,000 or more there were 460,772 deaths recorded for 1937. A large majority (404,033) of the decedents were residents of the city in which death occurred. A smaller number (56,739) were of persons not residents of the city in which death occurred. Of these 56,739 nonresidents dying in cities of 100,000 or more, 11,466 lived in some other city of 100,000 or more; 6,981, in some city of 25,000 to 100,000; 6,347, in cities of 10,000 to 25,000; 8,597, in cities of 2,500 to 10,000; and 23,348, in rural areas. The data given in a column of the table refer to the distribution of residents of a population-size group classified according to the place of death. For example, there were 437,334 decedents who were residents of cities having populations of 100,000 or more. Of these, 404,033 died in the city of which they were residents, and 33,301 died in some other area. The deaths of the 33,301 occurred in the following places: 11,424, in cities of 100,000, but not in the specific city in which the decedent was a resident; 3,935, in cities of 25,000 to 100,000; 2,178, in cities of 10,000 to 25,000; 2,885, in cities of 2,500 to 10,000; and 12,879, in rural areas.

A careful study of table H reveals general information concerning the areas from which nonresidents came, and the areas to which they went. More specific details regarding the nonresident movement for individual States, cities, and counties can be obtained from the general tables.

TABLE H.—ALLOCATION OF DEATHS TO PLACE OF RESIDENCE, BY POPULATION GROUPS: UNITED STATES, 1937

(Exclusive of stillbirths)

PLACE OF OCCURRENCE	Total deaths	Deaths of residents in area	Total deaths of nonresidents	PLACE OF RESIDENCE IN ANY STATE BY—				
				Cities of—				Rural
				100,000 or more	25,000 to 100,000	10,000 to 25,000	2,500 to 10,000	
Total	1,450,427			437,334	161,186	116,494	165,108	570,305
Deaths of residents in area		1,270,553		404,033	140,992	98,117	142,494	484,917
Deaths of nonresidents			179,874	33,301	20,194	18,377	22,614	85,388
Cities of 100,000 or more	460,772	404,033	56,739	11,424	7,023	6,332	8,597	23,363
Cities of 25,000 to 100,000	176,836	140,992	35,844	3,935	2,356	2,928	5,200	21,425
Cities of 10,000 to 25,000	126,192	98,117	28,075	2,178	1,367	1,832	3,709	18,969
Cities of 2,500 to 10,000	158,231	142,494	15,737	2,885	1,962	1,381	1,571	7,938
Rural	528,396	484,917	43,479	12,879	7,466	5,904	3,537	13,693

The effect of the resident reallocation on data for population-size groups is summarized in table I. This table shows for each population group the total number of deaths of residents wherever occurring, and the total number of deaths occurring in each area. The ratios in the last column are the ratios of the recorded deaths to the resident deaths. For all cities over 10,000 as a group, the number of recorded deaths exceeds the number of resident deaths, whereas for cities of 2,500 to 10,000 and for rural areas the recorded deaths are fewer than the resident deaths. Cities of 25,000 to 100,000 are most affected by reallocation since for this group the number of deaths recorded is 109.7 percent of the number of resident deaths.

TABLE I.—DEATHS OF RESIDENTS AND DEATHS OCCURRING IN POPULATION-SIZE GROUPS: UNITED STATES, 1937

(Exclusive of stillbirths)

POPULATION-SIZE GROUP	Total deaths of residents	Total deaths in area	Ratio of recorded deaths to resident deaths
Cities of 100,000 or more	437,334	460,772	105.36
Cities of 25,000 to 100,000	161,186	176,836	109.71
Cities of 10,000 to 25,000	116,494	126,192	108.32
Cities of 2,500 to 10,000	165,108	158,231	95.83
Rural	570,305	528,396	92.65

The number of recorded deaths, resident deaths, and ratios similar to those given in table I for population groups are given in table J for individual cities having populations of 100,000 or more.

DEATHS IN HOSPITALS AND OTHER INSTITUTIONS

The connection between nonresident deaths and institutional deaths is indicated by table K. This table shows for each State the proportion of all deaths registered and the proportion of nonresident deaths which occurred in hospitals or other institutions.

For the entire United States, 36.7 percent of all deaths occurred in institutions but for individual States the proportion varies from 9.0 percent in Wyoming, 14.3 percent in Arkansas, and 14.6 percent in Mississippi to 52.4 percent in California and 50.2 percent in New York. The District of Columbia shows the high figure of 60.8.

For the nonresident deaths, the proportion of deaths in institutions is much greater. Of the 179,874 nonresident deaths in the United States for 1937, 77.4 percent occurred in hospitals or institutions. The large proportion of hospital deaths for nonresidents is to be expected, since hospitals usually serve a larger area than just the city or county in which they are located. However, it should not be forgotten that many nonresident deaths (22.6 percent) did not occur in institutions, and this would seem to indicate that the desire for hospital services was not the only factor in the nonresident movement. Table K shows that in every State the proportion of nonresident deaths in institutions is definitely greater than the proportion of all recorded deaths.

TABLE K.—PERCENTAGE OF RECORDED DEATHS AND OF NONRESIDENT DEATHS, OCCURRING IN INSTITUTIONS: EACH STATE, 1937

(Exclusive of stillbirths)

AREA	TOTAL DEATHS IN AREA			DEATHS OF NONRESIDENTS IN AREA		
	Total	In institution	Not in institution	Total	In institution	Not in institution

Because so many nonresident deaths are institutional deaths, the use of hospital facilities by the inhabitants of other States or other specified areas is more correctly indicated by data reallocated to place of residence than by data based on deaths as recorded in each area. Table L shows the proportion of deaths of residents of each State which occurred in institutions and the comparable proportion for all deaths occurring in each State irrespective of place of residence. The table also shows proportions for cities of 10,000 and over, and for cities of 2,500 to 10,000 and rural.

For State totals, the proportion of recorded deaths occurring in institutions corresponds closely with the proportion of deaths of residents occurring in institutions. This statement does not apply, however, for urban or rural population groups. Considering deaths on the basis of place of occurrence, 50.9 percent of deaths in cities of 10,000 or more occurred in institutions but only 20.8 percent of the deaths in areas under 10,000 were institutional. Reallocating the data to place of residence, the corresponding figures become 47.1 for urban places and 26.5 for areas under 10,000. For some States, the differences are much greater. For example, in South Carolina, 52.3 percent of all deaths in cities of 10,000 or more occurred in hospitals or other institutions, but this figure is not indicative of the utilization of hospital facilities by the urban residents of South Carolina since only 37.2 percent of the deaths of residents of such cities occurred in institutions. The opposite change is observed for the small cities and rural areas.

The "institutional" grouping in tables K and L is based on the institution code index and all types of hospitals, et cetera, are included under the broad term "institution." For deaths, institutions are, for the most part, general hospitals. Table M shows for 1936 the number of deaths and the percent of these deaths occurring in each broad class of institution. Of the total number of deaths, 64.9 percent occurred in no institution, 27.0 percent in general hospitals, and 8.1 percent in other types of hospitals and institutions. For 1937 the proportion of deaths occurring in institutions would no doubt be similar. Reference should be made to the code outline on page 6 for the classification of specific types of institutions.

TABLE L.—PERCENTAGE OF RESIDENT DEATHS AND OF RECORDED DEATHS, OCCURRING IN INSTITUTIONS: EACH STATE, CITIES OF 10,000 OR MORE, AND RURAL, 1937

(Exclusive of stillbirths. The term "rural" used in this table includes cities of 2,500 to 10,000 as well as the rural parts of the State)

BIRTHS ALLOCATED TO PLACE OF RESIDENCE

SUMMARY FOR BIRTHS.—Of a total of 2,203,337 births registered in the United States for 1937, 1,873,337 occurred in the city or county where the mother of the child usually resided, and 330,000 (15.0 percent) were nonresident births. The proportion of total births which were of nonresidents is slightly greater than the proportion of nonresident deaths (12.4 percent). A large proportion of these nonresident births were to mothers who lived in rural areas or small cities and gave birth in areas more urban. Classified in broad population groups (as shown in table T), 208,594 (63.2 percent) of the nonresident births represent the movement to larger population groups; 67,857 (20.6 percent) represent the movement between areas in the same population-size group; and 53,549 (16.2 percent) represent the movement to smaller population-size groups. As might be expected, this movement from rural areas or small cities to larger urban places is largely an intrastate movement as only 24,237 (7.3 percent) of all nonresident mothers crossed State lines. However, in the case of deaths, a greater number of long-distant movements occurred and 28,610 (15.9 percent) of all nonresidents crossed State lines.

A summary of births by place of occurrence and by place of residence is given for States in table N. This table shows, for each State, the number of births registered as occurring within the State; the total number of nonresident births within the State, that is, the number of births occurring in cities or counties of which the mother is not a resident; the number of these occurring to nonresident mothers who live in some other part of the same State; and the number to mothers living in other States. The table also shows the number of births of residents of each State occurring in other areas, and the total births of residents wherever occurring. For most States, the total number of births occurring within the State is approximately equal to the total number of births of residents wherever occurring.

TABLE N.—BIRTHS OF NONRESIDENTS IN EACH STATE AND BIRTHS OF RESIDENTS IN OTHER STATES: 1937

(Exclusive of stillbirths)

NUMBER OF NONRESIDENT BIRTHS.—Although, for the entire United States the nonresident births are 15.0 percent of all births, this proportion varies widely among States. In some States the percent of all births which are nonresident is less than 5 percent (Alabama, 4.3 and Florida, 4.0), whereas in other States the percentage is above 25 (New Jersey, 37.2; Connecticut, 28.9; Rhode Island, 27.1; and Massachusetts, 26.4). Table O gives the total number of births occurring in each State, and the number and percent that occurred in a city or county of which the mother was not a resident. The frequency distribution of this percentage for States is given in table P. Fourteen States had less than 10 percent of nonresident births and 4 States had more than 25 percent.

TABLE O.—BIRTHS OF NONRESIDENTS AND PERCENT OF TOTAL RECORDED BIRTHS: EACH STATE, 1937

0- 4	2
5- 9	12
10-14	10
15-19	13
20-24	8
25-29	3
30-34	
35-39	1

The proportion of nonresident births varies greatly for different population-size groups. Since many births are nonresident because of the use of urban hospitals by residents of more rural areas, it is to be expected that there will be a high proportion of nonresident births in cities. Table Q, which gives the proportion of nonresident births for each population-size group, indicates that the proportion of nonresident births is greatest for cities having populations of 10,000 to 25,000. Large cities having populations of over 100,000 have practically the same proportion of nonresident births as the total United States, whereas very small cities (2,500 to 10,000) and rural areas have smaller proportions.

Table R gives the total number of births occurring in each city of 100,000 or more, and the number and percent which were of nonresidents of the city. The variation of individual cities is greater than that for States. Chicago, Illinois, has the smallest percent of nonresident births (3.6) and Camden, New Jersey, has the highest percent (46.1). Most of the 93 cities have between 10 and 20 percent of nonresident births. In only 11 cities are there less than 10 percent, whereas 20 cities have more than 25 percent. The frequency distribution of cities in reference to the percent of nonresident births is given in table S. Since many factors contribute to the number of nonresident births occurring in a community, a careful study of local conditions is necessary to explain such large differences as are noted. Important factors are: the number and location of hospitals in suburbs surrounding a given city; the density of population in adjacent rural areas, and the distance to other cities; the extent to which hospital facilities are available or utilized by inhabitants of the area, et cetera.

TABLE Q.—PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED BIRTHS BY POPULATION GROUPS: 1937

(Exclusive of stillbirths)

POPULATION GROUP	PERCENT NONRESIDENTS
United States	15.0
Cities of 100,000 or more	15.9
Cities of 25,000 to 100,000	27.2
Cities of 10,000 to 25,000	32.4
Cities of 2,500 to 10,000	12.7
Rural	7.9

CHANGES IN BIRTH STATISTICS FOR POPULATION-SIZE GROUPS

The changes in birth statistics for population-size groups due to reallocation to place of residence are given in Table T. Reading horizontally, this table shows the total number of births occurring in each area, subdivided into the number that are residents of the particular place of birth and the number that are nonresidents. The number of nonresident births in each area is subdivided according to the population-size group of the place of residence. Reading vertically, the table gives for each size-group the total number of resident births, the number of those born at the place of residence, and the number born at some other place. For the residents born at some other place, the figures in the column show the number born in each population-size group.

TABLE T.—ALLOCATION OF BIRTHS TO PLACE OF RESIDENCE, BY POPULATION GROUPS: UNITED STATES, 1937

(Exclusive of stillbirths)

PLACE OF OCCURRENCE	Total births	Births of residents in area	Total births of non-residents	PLACE OF RESIDENCE IN ANY STATE BY—

Scranton	2,105	2,702	128.4				

The data given in table T are summarized in table U which shows the number of births to residents of each population-size group and the number of births occurring in each size-group. The ratio in the final column of table U indicates the importance of the difference between data classified by place of occurrence and by place of residence. When the birth data for 1937 were classified by place of occurrence, the number of births for cities of 25,000 to 100,000 was 116.7 percent of the number of births to residents of those areas. For rural areas, when the data were classified by place of occurrence, only 89.2 percent of the total births to rural residents were classified under rural.

Similar ratios are given in table V for each city of 100,000 or more. Although there are a few exceptions, most cities of this size have more recorded births than resident births. Exceptions to this general rule are Chicago, Ill.; Grand Rapids, Mich.; Los Angeles, Calif.; Lynn, Mass.; Miami, Fla.; Reading, Pa.; and Somerville, Mass.

162828 O—39—2

BIRTHS IN HOSPITALS

Table W shows, for each State, the proportion of all recorded births and the proportion of nonresident births occurring in hospitals. In Alabama, Arkansas, Kentucky, Mississippi, South Carolina, West Virginia, and Wyoming less than 15 percent of all recorded births occurred in hospitals. In other States, the proportion of births occurring in hospitals is very high. In Connecticut, the percentage was 82.7; New York, 79.8; California, 78.2; and Massachusetts, 76.6. In the United States 44.8 percent of all births recorded in 1937 were hospital births.

For nonresident births the table shows a much higher percentage proportion of hospital cases. In the United States, 81.2 percent of all nonresident births occurred in hospitals and in 9 States and the District of Columbia this percentage was over 90. Some of the States having the highest percentages are: Massachusetts, 98.4; Connecticut, 98.2; New York, 98.2; and New Jersey, 98.0. The District of Columbia had a percentage of 99.3.

TABLE W.—PERCENTAGE OF RECORDED BIRTHS AND OF NONRESIDENT BIRTHS, OCCURRING IN HOSPITALS: EACH STATE, 1937

The use of hospitals for confinements by the inhabitants of any area is more correctly indicated by data reallocated to place of residence than by data based on place of birth. This information for States and certain population-size groups is given in table X which shows the proportion of resident births of each area occurring in hospitals and the proportion of the recorded births in each area occurring in hospitals. For State totals, reallocation to place of residence does not greatly change the proportions, but for cities of 10,000 or more as a group, and for cities of 2,500 to 10,000 and rural, as shown in table X, there are marked changes. Although much greater changes can be observed for certain States, the general effect of reallocation can be seen from the national figures. Tabulated by place of occurrence, 75.1 percent of the births in cities of 10,000 or more and 16.3 percent of births in cities of 2,500 to 10,000 and rural places, were hospital births. When the data are reallocated to place of residence, 71.3 percent of the births to residents of cities of 10,000 or more and 24.9 percent of the births to residents of cities of 2,500 to 10,000 and rural areas, occurred in hospitals.

TABLE X.—PERCENTAGE OF RESIDENT BIRTHS AND RECORDED BIRTHS, OCCURRING IN HOSPITALS: EACH STATE, CITIES OF 10,000 OR MORE, AND RURAL, 1937

(Exclusive of stillbirths. The term "rural" used in this table includes cities of 2,500 to 10,000 as well as the rural parts of the State)

The hospital coding and classification for birth statistics is not based on the institution code used for mortality. The births are coded with a simple code which indicates only whether or not the birth took place in a hospital.

GENERAL NATALITY AND MORTALITY TABLES

1/ Inasmuch as nonresidents of one city or county in the State may be residents of some other city or county in the same State, the State totals indicate the number of persons born within the State who were not residents of the particular place of birth, but do not indicate the number of nonresidents of the entire State.

2/ See note 1; the same explanation applies to deaths.

3/ Inasmuch as nonresidents of a city may be residents of the county in which the city is located and vice versa, it is not possible to add the rural and city figures to obtain the totals for the county.

4/ Includes only data for Texarkana, Ark.

5/ Includes only data for Bristol, Tenn.

6/ Includes only data for Texarkana, Tex.

7/ Cities of Virginia are independent, each having the same status as a county. Cities of 10,000 inhabitants or more include: Charlottesville, Alexandria, Staunton, Lynchburg, Petersburg, Winchester, Richmond, Suffolk, Norfolk, Portsmouth, Danville, Hopewell, Roanoke, and Newport News.

8/ Includes only data for Bristol, Va.

9/ Includes only data for Bluefield, W. Va.

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Elwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.

1/ Inasmuch as nonresidents of one city or county in the State may be residents of some other city or county in the same State, the State totals of nonresidents indicate the number of persons born within the State who were not residents of the particular place of birth, but do not indicate the number of nonresidents of the entire State.

TABLE 5.—DEATHS OF NONRESIDENTS DISTRIBUTED BY POPULATION-GROUP CLASSIFICATION OF PLACE OF RESIDENCE: EACH STATE, 1937

(Exclusive of stillbirths)

1/ Inasmuch as nonresidents of one city or county in the State may be residents of some other city or county in the same State, the State totals of nonresidents indicate the number of persons dying within the State who were not residents of the particular place of death, but do not indicate the number of nonresidents of the entire State.

TABLE 6.—ALLOCATION OF DEATHS FROM SELECTED CAUSES TO PLACE OF RESIDENCE BY POPULATION GROUPS: UNITED STATES, 1937

1/ Inasmuch as nonresidents of one city or county in the State may be residents of some other city or county in the same State, the State totals indicate the number of persons born within the State who were not residents of the particular place of birth, but do not indicate the number of nonresidents of the entire State.

2/ See note 1; the same explanation applies to deaths.

3/ Inasmuch as nonresidents of a city may be residents of the county in which the city is located and vice versa, it is not possible to add the rural and city figures to obtain the total for the county.

4/ Includes only data for Texarkana, Ark.

5/ Includes only data for Bristol, Tenn.

6/ Includes only data for Texarkana, Tex.

7/ Cities of Virginia are independent, each having the same status as a county. Cities of 10,000 inhabitants or more include: Charlottesville, Alexandria, Staunton, Lynchburg, Petersburg, Winchester, Richmond, Suffolk, Norfolk, Portsmouth, Danville, Hopewell, Roanoke, and Newport News. Figures for the remaining cities are included in "rural."

8/ Includes only data for Bristol, Va.

9/ Includes only data for Bluefield, W. Va.

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Elwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.

TABLE 10.—RESIDENT AND RECORDED DEATHS FROM TUBERCULOSIS, CANCERS AND OTHER MALIGNANT TUMORS, AND PUERPERAL CAUSES: EACH STATE, COUNTY, AND CITY, 1935

(*Exclusive of stillbirths.* The term "rural" used in this table includes cities of 2,500 to 10,000 as well as the rural parts of the State. Numbers under causes of death are those in the 1929 revision of the detailed International List)

AREA	TUBERCULOSIS (ALL FORMS) (23-32)		CANCERS AND OTHER MALIGNANT TUMORS (45-53)		PUERPERAL CAUSES (140-150)

1/ Includes only data for Texarkana, Ark.

2/ Certain cities listed in this table are located in more than one county. Data for these cities have been tabulated as one area and are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Elwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.

3/ Includes only data for Bristol, Tenn. 4/ Includes only data for Texarkana, Tex.

5/ Cities of Virginia are independent, each having the same status as a county. Cities of 10,000 inhabitants or more include: Charlottesville, Alexandria, Staunton, Lynchburg, Petersburg, Winchester, Richmond, Suffolk, Norfolk, Portsmouth, Danville, Hopewell, Roanoke, and Newport News. Figures for the remaining cities are included in "rural."

6/ Includes only data for Bristol, Va. 7/ Includes only data for Bluefield, W. Va.
