

1990 National Health Interview Survey (NHIS)  
of Health Promotion and Disease Prevention (HPDP)  
Pregnancy and Smoking File

INTRODUCTION

1. The 1990 Pregnancy and Smoking file is very similar to the 1985 Pregnancy and Smoking file; most items are identical.
2. A record exists for every woman 18-44 years of age in the NHIS sample. For women who were not interviewed, dummy records were created. Smoking questions were asked only of women who had had a live-born child in the past 5 years or were currently pregnant. All women who did not meet these criteria, as well as women for whom we had no information (dummy records), have blanks in all supplement fields beginning in location 343 (Question 4 - Ever smoked 100 cigarettes).
3. The Pregnancy and Smoking file consists of:
  - a. The NHIS person record from the core questionnaire (locations 1-200)
  - b. Weight fields (locations 201-212)
  - c. The special topic data (locations 336-400)
4. The response rate for the Pregnancy and Smoking portion of the NHIS of Health Promotion and Disease Prevention was 89.6 percent. This response rate was calculated as follows:

Household response rate from core (95.5 percent)  
multiplied by the Supplement response rate (92.8  
percent)

= 88.6 percent

5. Weights:

Weights must be used to make accurate estimates based on data from the National Health Interview Survey. Two weights are included on the 1990 Pregnancy and Smoking file:

- a. The Final Basic Weight (location 207-212), calculated for each woman 18-44 years of age in the family, is the weight that will be used in most analyses of the Pregnancy and Smoking data. This weight is the functional equivalent of the Annual Final Basic Weight found on the NHIS Person Record of the Basic Health and Demographic component of the survey (i.e., the Core questionnaire).
- b. The Interim Basic Weight (before age-sex-race adjustment), required by some software packages for variance estimation for surveys with complex sample designs, is also included on the file (loc. 201-206).

1

6. Estimating numbers of events or conditions

- a. To reduce respondent error, the recall period for questions about some events is limited to two weeks. These events are: bed days and other restricted activity days, work loss and school loss days, and doctor visits. The two-week variables are found in locations 98-107 and 120-121. Estimates of the total number of occurrences of these events in the population can be derived as follows:

Number of events x 26 (number of two-week periods in a year) x Final Basic Weight

= Total number of events occurring in the population during the data year, i.e., 1990.

Example: Number of bed days (loc. 100-101) x 26 x Final Basic Weight (loc. 207-212) = total number of bed days reported for the population in 1990.

- b. The recall period for acute incidence conditions is also two weeks and an annual estimate of the total number of acute incidence conditions is calculated using the same procedures as for two-week events:

Number of acute incidence conditions x 26 x Final Basic Weight

= Total number of acute incidence conditions occurring in the population during 1990.

Note: An acute incidence condition is an acute condition with onset during the two weeks preceding the date of interview.

- c. The recall period for information on hospitalizations is 12 months. However, in calculating number of discharges and number of days in hospital (locations 132-141), only discharges occurring in the past 6 months are counted. Therefore, the weighted estimates for these events must be calculated as follows:

(1) Number of discharges x 2 (number of 6-month periods in a year) x Final Basic Weight

= Total number of discharges occurring in the population in one year.

(2) Number of days in hospital associated with discharges occurring in the past 6 months x 2 (number of 6-month periods in a year) x Final Basic Weight

1

= Total number of days of hospitalization occurring in the population in one year.

Note: On this file, "population" refers to all women 18-44 years of age.

7. Calculation of rates for events and conditions:

The number of events or conditions estimated for the population, as described in item 7, above, can be used as the basis for calculating rates of occurrence of these events (or conditions) per person and per 100 persons for the total U. S. population and for various population subgroups.

Note: Only rates can be estimated from these data. The percent of the population experiencing a particular type of event during the data year cannot be estimated. {The percent of the population experiencing the event in the reporting period (i.e., two weeks or 6 months) can be estimated but is generally not meaningful.}

8. Data on hospital episodes and days, based on a 12-month recall are locations 122-131. The Final Basic Weight is used for calculating estimates of these events in the same way it is used for all other person-based variables. These variables do permit estimating the percent of the population experiencing a hospital episode in the past year and the percent of the population having a specified number of hospital days.
