Hawaii, Puerto Rico, and the Virgin Islands

SUPPLEMENT

Hawaii

The Territory of Hawaii was admitted to the death-registration area in 1917 and to the birth-registration area in 1929.

The number of live births reported in Hawaii in 1937 was 8,983. Of these, 3,236, or 36 percent, were Japanese; 2,119, or 24 percent, were Part-Hawaiian; 1,562, or 17 percent, were Caucasian; 1,127, or 13 percent, were Filipinos; 468, or 5 percent, were Chinese; and 329, or 4 percent, were Hawaiian.

The number of deaths from all causes in Hawaii in 1937 was 3,547, and the estimated population was 399,000, giving a crude death rate of 8.9 per 1,000 population against 8.7 in 1936. The highest death rates per 100,000 population in 1937 were: For diseases of the heart (all forms) 122.8; pneumonia (all forms), 92.7; tuberculosis (all forms) 79.7; cancers and other malignant tumors, 75.2; and nephritis, 69.2. These five causes account for more than 49 percent of all deaths.

Deaths under 1 year numbered 619, equivalent to a rate of 68.9 per 1,000 live births, against 73.1 in 1936. More than 56 percent of these infant deaths were due to pneumonia (all forms), premature birth, and diarrhea and enteritis, the rates for these causes being 19.4, 12.6, and 6.7, respectively. The most marked decrease in any mortality rate in 1937 is shown for diseases of the heart (all forms) from 134.5 to 122.8; the largest increase shown is for pneumonia (all forms), from 74.1 to 92.7.

Puerto Rico

Puerto Rico was admitted to the death-registration area in 1932. The number of deaths from all causes in Puerto Rico in 1937 was 37,129 and the estimated population was 1,774,000, giving a crude death rate of 20.9 per 1,000 population, against 20.0 in 1936. The highest crude death rates per 100,000 population were: For diarrhea and enteritis (under 2 years), 305.6; tuberculosis (all forms), 286.4; pneumonia (all forms), 189.6; diarrhea and enteritis (2 years and over), 168.7; nephritis, 133.7; malaria, 127.5; and diseases of the heart (all forms), 118.4. These seven causes account for 63.5 percent of all deaths. The greatest increase in any mortality rate in 1937 was 29.3 for pneumonia (all forms) and the greatest decrease (19.1) was in the rate for diarrhea and enteritis (under 2 years).

Virgin Islands

The Virgin Islands—St. Croix, St. Thomas, and St. John—were admitted to the birth- and death-registration areas in 1924.

A special census of the population of these islands was taken by the Bureau of the Census in 1930. The population then numbered 22,012, of which 78.3 percent were Negroes. Because of the continuous decrease of the population from 1860 to 1930, rates have not been computed.

In 1937, 725 births were reported in the Virgin Islands, and of this number the Negro births represented over 70 percent. There were 498 deaths in 1937, nearly 78 percent of which were deaths of Negroes.

The largest number of deaths resulted from diseases of the heart (all forms), nephritis, congenital malformations and diseases of early infancy, cancers and other malignant tumors, pneumonia (all forms), tuberculosis (all forms), diarrhea and enteritis (under 2 years), cerebral hemorrhage, syphilis, pellagra, and leprosy. These diseases accounted for more than 78 percent of all deaths.

Deaths under 1 year numbered 90 and represent an infant mortality rate of 124.1 per 1,000 live births, which is 18.7 higher than the corresponding rate (105.4) for 1936. Nearly 59 percent of all deaths occurring among infants under 1 year of age were caused by diarrhea and enteritis, premature birth, and pneumonia (all forms), the rates for these causes being 30.3, 23.4, and 19.3, respectively. The infant mortality rate for Negroes was 130.9, or 13.6 higher than the corresponding rate (117.3) for 1936.
