SUMMARY AND RATE TABLES

Table I.—Population, number of births and deaths, and crude rates: the registration areas, United States, 1900-1937 16

Table II.—Enumerated population by cities and rural areas, and by race: United States and each State, April 1, 1930 16

Table III.—Enumerated population by age, race, and sex: United States, April 1, 1930 17

Table IV.—Estimated midyear population: United States and each State, 1930-1937 18

Table V.—Population, number of births and deaths, and crude rates: specified foreign countries, 1935 18

Table VI.—Population, number of births and deaths, and crude rates: specified countries and selected years 19

Table VII.—Crude birth rates (number of live births per 1,000 estimated midyear population): United States, each division and State, 1915-1937 20

Table VIII.—Crude stillbirth rates (number of stillbirths per 1,000 live births): United States, each division and State, 1922-1937 21

Table IX.—Crude death rates (number of deaths per 1,000 estimated midyear population): United States, each division and State, 1915-1937 22

Table X.—Infant mortality rates (number of deaths under 1 year of age per 1,000 live births): United States, each division and State, 1915-1937 23

Table XI.—Deaths from each cause and crude death rates: United States, 1936 and 1937 24

Table XII.—Crude death rates (number of deaths per 100,000 estimated midyear population) for selected causes of death: United States, each division and State, 1937 28

Table XIII.—Births, deaths, infant mortality, and stillbirths: United States, 1937 30

Section A.—Cities having populations of 10,000 or more in 1930, cities having populations of 2,500 to 10,000 in 1930, and rural districts, in the United States and each State 30

Section B.—Each county (including cities having populations of 10,000 or more in 1930) 33

GENERAL TABLES

Live births

Table 1.—Live births by month and by population groups: United States and each State, 1937 85

Table 2.—Live births by race, parent nativity of white, and population groups: United States and each State, 1937 88

Table 3.—Live births by sex of child, age of mother, race, and parent nativity of white: United States and each State, 1937 91

Table 4.—Live births by sex of child and age of parents: United States and each State, 1937 104

Table 5.—Live births by number of child, age of mother, and race, and for white by nativity of mother: United States, 1937 116

Table 6.—Live births by number of child and race, and for white by nativity of mother: United States and each State, 1937 121

Table 7.—Cases of plural births classified by number of children born alive and stillborn, race, and sex: United States and each State, 1937 127

GENERAL TABLES—Continued

Stillbirths

VITAL STATISTICS OF THE UNITED STATES
PART I. GEOGRAPHIC CLASSIFICATION BY PLACE OF OCCURRENCE

Introduction

This volume—Vital Statistics of the United States, Part I—contains official statistical tabulations of natality and mortality data for the calendar year 1937. Detailed tables are given for live births, stillbirths, total deaths, and infant deaths in continental United States. Supplementary tabulations for Hawaii, Puerto Rico, and the Virgin Islands are also included. The natality data are classified by geographic area, race, sex, age and nativity of parents, etc. Mortality data are classified by geographic area, sex, age, race, cause of death, etc. The geographic classification refers to the place of birth or death, irrespective of the usual place of residence of the mother of the child, or the usual place of residence of the decedent. The tabulations are derived from transcripts of original birth and death certificates which are received from registration officials of States, cities, and outlying possessions of the United States.

This volume was prepared under the direction of Dr. Halbert L. Dunn, Chief Statistician for Vital Statistics, and Dr. John Collinson, Assistant Chief Statistician for Vital Statistics. Tabulations and introductory material were prepared under the immediate supervision of Dr. Forrest E. Linder, Social Science Analyst.

REVISION OF ANNUAL VITAL STATISTICS REPORTS

Prior to 1937, vital statistics data compiled by the Bureau of the Census were published annually in two volumes, "Mortality Statistics" and "Birth, Stillbirth, and Infant Mortality Statistics." The discontinuance of these two series of publications and the substitution of the present combined volume marks an important step in the steady progress of vital statistics in the United States. From the beginning, the principal compilations of birth and death statistics in the United States have been on a de facto geographic basis—that is, births and deaths were tabulated according to the place in which the birth or death occurred, without regard to the usual place of residence. The alternative is to tabulate on a de jure geographic basis, allocating each birth and death to the State, city, and county of residence, or usual place of abode.

The difference between these two methods of tabulation should be emphasized. Many births and deaths occur in cities or counties of which either the mother of the child or the decedent is not a usual resident. These births and deaths are nonresident—a result of temporary movements of the residents of one geographic area to another. This continuous shifting of the population occurs for a number of reasons, one of which is the desire to take advantage of hospital facilities not available in the city or county of usual residence. Inasmuch as the population census is compiled according to the usual place of abode, the tabulation of vital statistics on a de facto basis has therefore seriously restricted, for certain purposes, the use of these data.

Important as it is to tabulate births and deaths by place of residence, it is not desirable to make a sharp break in the series of comparable statistics previously published. For national totals the two types of tabulations would be identical, since an international exchange of nonresident births or deaths is neither feasible nor necessary. For State totals the difference would, in most cases, be negligible. Furthermore, for certain administrative purposes tabulations by place of occurrence are required. The data included in part I are therefore a continuation of the figures published for prior years in the annual volumes "Mortality Statistics" and "Birth, Stillbirth, and Infant Mortality Statistics." Data compiled on a de jure basis will be published in a second volume entitled "Vital Statistics of the United States, Part II."

In addition to combining the birth and death statistics in a single volume, the tables have been revised extensively. This revision was made so that the data presented might be more relevant to modern social and medical problems. Certain tables of decreasing interest have been omitted, whereas other tables have been expanded or new ones added. These revisions have been based on the results of a survey of the needs of many important social agencies and individual users of vital statistics. Acknowledgment is made for the numerous valuable suggestions and comments received. Many of these suggestions are incorporated in the present volume; others will form a basis for future improvements and extensions of tabulations.

COMPARABILITY OF CLASSIFICATION

CHANGES IN THE REGISTRATION AREAS.—The first vital statistics published by the Federal Government related to 1850, and were for the entire United States. These statistics were based on information collected during the decennial census of that year. Similar decennial collections were made by census enumerators at each census up to and including the census of 1900. The interval between the occurrence of a birth or a death and the census enumeration resulted in inaccurate and incomplete reports on births and deaths. Since several States had developed efficient systems for the registration of vital statistics, the Bureau of the Census, in 1880, established a national "registration area" for deaths. This original area consisted of only two States—Massachusetts and New Jersey—the District of Columbia, and several large cities, but by 1900 eight other States had been admitted. For the years 1880, 1890, and 1900, mortality data were received from the States and cities included in this expanding area, and both birth and death figures for the entire country were compiled from the reports of census enumerators.

The annual collection of mortality statistics for the registration area began with the calendar year 1900. In 1902, the Bureau of the Census, which had previously functioned only in census years, was made a permanent agency by an act of Congress. This act authorized the Director of the Bureau of the Census to obtain, annually, copies of records filed in the vital statistics offices of those States and cities having adequate death-registration systems. At that time, not all the States had enacted laws requiring the registration of births and deaths and in many States the existing laws were poorly enforced. Important dates in the historical development of vital statistics in the various States and the year in which each State was admitted to the national registration areas are given in table A.

The death-registration area for 1900 consisted of 10 States, the District of Columbia, and a number of qualified cities in nonregistration States. The gradual growth of this area by the addition of more States is shown in table B, which gives for each year the estimated midyear population of the whole United States, and the number of States and the estimated population included in the registration area.

TABLE A.—IMPORTANT DATES IN THE HISTORY OF BIRTH AND DEATH REGISTRATION: UNITED STATES

STATE	FIRST STATE REGISTRATION LAW ENACTED		Enactment of present law (model or conforming to model law) births and deaths	RECORDS ON FILE FOR ENTIRE STATE		ADMITTED TO REGISTRATION AREA

1880 1/	50,155,783	2	8,538,366	17.0			

1/ Figures are for Census year ending May 31.

NOTE.—For every year the District of Columbia was in both areas, but is not included in the "number of States"; the death area also included a varying number of registration cities in nonregistration States.

Inasmuch as it is more difficult to obtain accurate and complete registration of births than of deaths, the national birth-registration area was not established until 1915. For this reason no birth statistics were published by the Bureau of the Census from 1900 to 1914. The original birth-registration area of 1915 consisted of 10 States and the District of Columbia, but other States were gradually added in the years following. The growth of this area is indicated also in tables A and B.

In 1933, for the first time, both the birth- and death-registration areas included all States, and since that year the annual publications have referred to the entire United States.

The change in areas for which data have been collected and tabulated makes it impossible to obtain a national series of geographically comparable data prior to 1933. However, rates for the registration areas are an approximation to complete national rates and, for general purposes, comparisons over a long period of years can be made. Crude birth and death rates for the registration areas of each year are given in table I and crude rates for the individual States are given in tables VII and IX.

GEOGRAPHIC CLASSIFICATION.—The geographic code used in tabulating the data published in this report gives a separate identifying number to each city having a population of 10,000 or more in 1930, and to certain towns and townships each having a population of 10,000 or more and a population density of 1,000 or more per square mile. The code also gives a separate number to each county, exclusive of these cities. Although villages and cities having populations of less than 10,000 are not individually identified, each county is separated into two parts, one consisting of "incorporated places" of 2,500 to 10,000, and another consisting of the remainder of the county. In this report most of the tables containing classifications by size-of-population groups show cities of 10,000 or more, cities of 2,500 to 10,000, and rural. Certain tables give a more detailed five-group classification, namely, cities having populations of 100,000 or more; cities of 25,000 to 100,000; cities of 10,000 to 25,000; cities of 2,500 to 10,000; and rural. This finer classification is given where feasible, in order to break up somewhat the heterogeneity of large population groupings.

Prior to 1930 the annual vital statistics data were tabulated in two general groups—urban and rural. In this classification the urban group included all cities of 10,000 inhabitants or more and a few densely populated towns and townships. The rural included all remaining areas. These definitions were consistent with those used in the 1920 population census. The definitions used for the 1930 population census were changed so that "urban" included all cities with populations in excess of 2,500, and "rural" included the remaining areas. To give annual vital statistics data which could be related to the population census, it was necessary, therefore, to divide into two groups the group previously defined as rural in vital statistics. Thus, by combining the areas of 2,500 to 10,000 with the urban, figures could be obtained that were comparable with those of the 1930 census. Also, by combining the areas of 2,500 to 10,000 with the rural, figures could likewise be obtained that were comparable to the rural as given in the vital statistics reports prior to 1930.

Most natality and mortality tables published since 1930 show the three-way population classification: cities in excess of 10,000, cities of 2,500 to 10,000, and rural; but in some tables the simple classifications "urban" and "rural" are used. In these instances, where the dichotomous classification is shown, the rural includes all areas except the cities of 10,000 or more. In the present volume the ambiguous terms "urban" and "rural" are avoided, and the table headings indicate the composition of each population group.

CLASSIFICATION BY RACE.—The detailed racial classification given in this volume shows births and deaths classified by white, Negro, Indian, Chinese, Japanese, and a residual group of numerically minor races. In most tables such an extended classification is not justified and the racial divisions are "white," "Negro," and "other races," or, in tables where the main purpose is to isolate the major group, the classifications are simply "white" and "all other." In any case where the racial designation on the birth or death certificate is Mexican, the birth or death is tabulated with "white." This allocation of Mexican births and deaths is consistent with that used prior to 1930 and for the years 1935 and 1936. In the annual reports for the years 1930 to 1934, the Mexicans were not classified with the "white" but were tabulated with "other races."

INTERNATIONAL LIST OF CAUSES OF DEATH.—The data in the mortality reports published by the Bureau of the Census are tabulated according to the numbers and titles of the detailed International List of Causes of Death. Complete titles of this list, with the official numbers and subdivisions, are given in the stub of table XI. In some tables it is necessary, on account of space limitations, to abbreviate cause-of-death titles or to indicate the composition of groups of causes by giving the list numbers. In such cases, reference may be made to table XI, or to the Manual of the International List of Causes of Death for the complete titles. The manual indicates, also, the main diseases included in each title.

The International List is revised decennially in order that the terminology by which deaths are classified may be consistent with advances in medical science and changes in diagnostic practice. The list used in this volume was adopted by the International Commission on the International List of Causes of Death, which met in Paris in 1929.

Special attention is directed to one feature of the 1929 list as used in these tables. Since the official list did not include titles for certain kinds of accidents, such as accidents in mines and quarries or motor-vehicle accidents, a supplemental list of 14 important classes of accidents was adopted. Deaths tabulated in this supplemental classification are also included under the proper official list titles. For example, in the case of an accident in which an automobile was driven from the road into a river and the driver was drowned, the death would be classified under International List number 183, which is drowning. In the supplemental tabulation this same death would be reclassified under symbol 210, automobile accident.

NATIVITY CLASSIFICATION.—Early mortality reports published by the Bureau of the Census contained extensive tables showing parent nativity as well as nativity of the decedent. Tables classifying deaths by the birthplace of the decedent and nativity of parents were discontinued in 1933.

More emphasis has been placed upon country of birth of parents in the birth statistics. Detailed tables showing specific country of birth of mother and specific country of birth of father, as well as more abridged classifications, have been published for each year through 1936. The historical importance of these data in tracing the changing composition of the population of the United States must be recognized. However, in recent years the number of births to foreign-born parents has become a relatively small proportion of the total. Accordingly, tables showing parent nativity for births have been eliminated or revised. A continued decrease in the proportion of births to foreign-born parents will justify a decreased emphasis on this classification in future volumes.

Table C gives the total number of births of white children in the increasing birth-registration area for each year beginning with 1915, and the percent of these having one or both parents of foreign birth. The same data are given for the 10 original birth-registration States. For this original registration area, white births of foreign or mixed parentage were 53.0 percent of all births in 1915, whereas in 1937 this group comprised 20.9 percent of the total. For the whole United States, in 1937, births of foreign or mixed parentage were only 11.9 percent of the total.

TABLE C.—WHITE LIVE BIRTHS OF FOREIGN PARENTAGE: EXPANDING AND ORIGINAL BIRTH-REGISTRATION AREAS, UNITED STATES

YEAR	EXPANDING BIRTH-REGISTRATION AREA			ORIGINAL BIRTH-REGISTRATION AREA (Exclusive of Rhode Island)		
	Total white live births	One or both parents foreign-born		Total white live births	One or both parents foreign-born	
		Number	Percent of total		Number	Percent of total
1937	1,928,437	230,381	11.9	595,225	124,447	20.9
1936	1,881,883	241,647	12.8	587,359	131,589	22.4
1935	1,888,012	259,613	13.8	589,409	141,957	24.1
1934	1,866,231	255,643	13.7	587,024	152,717	26.0
1933	1,794,946	267,426	14.9	578,841	161,375	27.9
1932	1,805,155	296,124	16.4	616,299	183,344	29.7
1931	1,848,293	330,772	17.9	641,636	204,288	31.8
1930	1,946,841	384,982	19.8	678,387	229,482	33.8
1929	1,924,475	407,022	21.1	678,482	241,070	35.5
1928	1,982,246	434,789	21.9	705,001	260,067	36.9
1927	1,925,585	458,038	23.8	726,931	277,949	38.2
1926	1,707,034	465,746	27.3	723,449	285,047	39.4
1925	1,731,669	487,707	28.2	746,083	303,025	40.6
1924	1,762,872	514,452	29.2	768,364	321,777	41.9
1923	1,644,034	501,124	30.5	752,860	323,070	42.9
1922	1,629,387	510,167	31.3	750,806	329,573	43.9
1921	1,565,446	496,815	31.7	739,173	332,443	44.7
1920	1,395,523	440,585	31.6	755,866	340,806	45.1
1919	1,269,363	439,135	34.6	714,815	346,200	48.4
1918	1,288,711	461,277	35.8	784,495	384,607	49.0
1917	1,280,288	482,211	37.7	788,214	403,616	51.2
1916	799,817	407,966	51.0	772,512	402,888	52.2
1915	763,899	405,014	53.0	763,899	405,014	53.0

QUALIFYING FACTORS IN INTERPRETATION AND USE OF DATA

While the data in this volume are available for a variety of administrative and scientific purposes, they cannot be correctly interpreted unless cognizance is taken of various qualifying factors. Obviously the factors to be considered depend upon the specific purposes for which the data are to be used. While it is not feasible, therefore, to catalog all of the pertinent factors in the use of vital statistics tabulations, a few of the more important should be mentioned.

Most of the factors qualifying the use of vital statistics data arise from imperfections in the original material or from the impracticability of tabulating or using these data in minute classifications. While these defects should not be ignored, their existence does not destroy the value of these tables for most general purposes. Analysis of small differences or exact evaluation and interpretation of vital statistics may require careful study of many related elements. However, the trend of crude birth and death rates, the increase or decrease in the number of deaths from selected causes, and the major differences in rates among States, are all facts which will not be materially changed by finer analysis.

AGE, SEX, RACE.—If crude death rates are used as an index of the health conditions of a community, comparisons of rates for different States or cities are not strictly valid unless the age, sex, and racial composition of the population of each area is considered. It is obvious that, if the population in one State is generally older than that in another, the crude death rate will be higher, even though there is no essential difference in the age-specific death rates.

Similar considerations apply also to crude birth rates. For example, comparison of birth rates of one area having a certain proportion of women of child-bearing age, with the rates of another community of a different population composition is erroneous, if the rates are used as a measure of intrinsic biological fertility.

Various methods have been devised to compensate for differences in the population composition of the areas to be compared. A necessary element of all such methods is the computation of specific birth or death rates for each of the factors to be considered. While the natality and mortality tables in

this volume are sufficiently detailed for the most important of these computations, it is also essential to have population figures for each separate age, sex, and racial group. Since detailed population data are not available for 1937, it is not possible to present specific rates. The crude rates given in the summary and rate tables are therefore subject to some limitation of use.

POPULATION ESTIMATES.—Since birth and death rates are ratios of the number of births and deaths to population figures, accurate rates are partially dependent upon accurate population figures. Tabulations showing the number and composition of the population for various areas are available only for the years when regular decennial population censuses are taken. For intervening years population estimates must be used.

Recent estimates for the population of the United States as a whole are based on the number of births and deaths which have occurred since the last census date, and the net immigration or emigration. Certain corrections have been made in the birth and death data for underregistration. The allowances for underregistration of births are based, in part, on recent tests conducted by the Bureau of the Census and on ratios computed from the 1930 census returns in comparison with the number of births registered during the year preceding the census. The net immigration figure represents, as nearly as it is possible to ascertain, the difference between the total number of persons, both citizens and aliens, who arrived in continental United States either from foreign countries or from outlying possessions, and the number of persons who left the United States for foreign countries or outlying possessions.

Inasmuch as there is no record of the movement of population from one State or city to another, it is not possible to employ for these smaller areas the method used in estimating the population of the United States. Population estimates for individual cities or counties, for population groups, or for separate races, have not been made by the Bureau of the Census since 1933, because it is believed that unavoidable errors in these estimates would be so great as to introduce serious errors into rates computed from them. Population estimates for States and the District of Columbia given in table IV are based on growth trends indicated by former censuses, as well as on local census data, school enrollment figures, directory counts, and other sources of local data.

PLACE OF RESIDENCE.—Official national vital statistics and those published by most State and city agencies have, for the most part, been compiled according to the place of birth or death. Under this system of tabulation, the data are tabulated by the city, county, or State in which the birth or death occurred, irrespective of the usual place of residence of the mother of the child, or the usual place of residence of the decedent.

The significance of this method of tabulation can be seen by considering the effect of population mobility on death rates. For example, the convenient hospital facilities in a city may attract patients from surrounding areas and, as a result, many of the deaths occurring in this city will not be deaths of residents of this city. The enumerated population of the city does not, under such conditions, represent the number of persons exposed to the risk of death; and the death rate does not accurately describe the mortality of this particular city. A more correct figure is obtained by reallocating all deaths to the place of residence. Since there are many causes contributing to the movement of patients to some area other than their usual place of residence, it cannot be assumed that the direction of the movement is always from rural areas to urban areas. In order to determine the direction or the magnitude of the difference between rates compiled according to place of occurrence and those compiled according to place of residence, it is necessary to examine tabulations compiled on both bases.

Since the data given in this volume are compiled according to place of occurrence, figures for individual cities or for population groups are not susceptible of final interpretation in terms of relative health conditions. Tabulations for States as a whole compiled on either basis are essentially the same. Detailed tabulations by place of residence are given in Vital Statistics of the United States, Part II.

COMPLETENESS OF REGISTRATION.—Although every State has adopted a vital statistics law requiring the registration of all births and deaths, these laws are not uniformly enforced. In most States where the registration organization is well established and where those persons responsible for filing certificates are appreciative of the value of registration to the individual, as well as its value for statistical purposes, practically all births and deaths are registered. In other States, however, the underregistration is enough to affect the use of the tabulated data for certain purposes.

Accurate information on the completeness of registration in each State is not available. One condition required for admission to the national registration areas was that there exist a demonstrated completeness of registration of at least 90 percent. Using this as a criterion, all of the States were admitted to the registration areas by 1933, and although registration has become more complete in most States, it is likely that there has been regression in some States. Estimates of the completeness of registration in States, based on the comparison of vital statistics reports and enumerated census data, have been published by several writers.

There is considerable evidence to show that birth registration is more incomplete than death registration. Especially incomplete is the registration of Negro births in isolated rural areas.

INTERPRETATION OF CAUSE-OF-DEATH TABLES

Cause-of-death data given in this volume are classified by the International List of Causes of Death. The use of this list in the tabulation of data by all States, and by various countries, results in similar cause-of-death titles for the various tables. Unfortunately, this use of a standard classification list, although essential for regional comparisons, does not assure strict comparability of the tabulated figures. At the present time, the type of statement given for the cause of death varies widely according to the care and consideration given to the certification of cause. A high degree of comparability could be attained only if the data on cause of death were reported with equal completeness and accuracy for every area. Table D gives, for 1935, the frequency distribution of States (including the District of Columbia) showing the percent of deaths coded International List numbers 199 and 200, namely, ill-defined causes of death. The variation in the accuracy of reporting throughout the country is indicated by the fact that in 27 States less than 1 percent of all deaths were classified in this ill-defined group, while in 6 States over 5 percent, and in 2 States over 10 percent were so classified. Obviously, if a high proportion of deaths is included in this poorly-defined cause-of-death class, it means that there is an unknown deficiency in the number of deaths classified in the more precisely defined groups.

The interpretation of data on cause of death is further qualified by the fact that, although in many instances the death is the result of a combination or sequence of causes, it is practicable to tabulate the death under one rubric only. This necessitates a choice of the primary cause from those given on the certificate. This selection of a primary cause is made according to rules given in the Manual of Joint Causes of Death. It is evident, however, that the effect of any such rules on the classification of deaths for specific causes will vary according to the completeness with which all the factors contributory to the death are reported. If a death is the result of several causes but only a single cause of death is given on the certificate, the Manual of Joint Causes of Death cannot, of course, be used. For this reason the omission of pertinent complicating factors or conditions adding to the risk of death may result in an incorrect assignment of cause. Table E gives, for 1936, the frequency distribution of States (including the District of Columbia) showing the percent of death certificates on which only a single cause of death was stated.

In 12 States more than 50 percent of all certificates had only a single cause of death. Contrasting with this, it can be noted from table E, that there were 5 States with less than 30 percent of the certificates reporting only a single cause. This wide variation in the amount of information given on the death certificate must have an appreciable effect on the exact meaning of death rates for specific causes.

Table D.—Frequency distribution of States showing the percent of deaths coded International List numbers 199 and 200: 1935

Percent coded 199 and 200	Number of States
0.0 - 0.9	27
1.0 - 1.9	7
2.0 - 2.9	6
3.0 - 3.9	1
4.0 - 4.9	2
5.0 - 5.9	2
6.0 - 6.9	1
7.0 - 7.9	0
8.0 - 8.9	1
9.0 - 9.9	0
10.0 +	2

Table E.—Frequency distribution of States showing percent of all death certificates having a single cause of death: 1936

Percent having single cause	Number of States
25.0 - 29.9	5
30.0 - 34.9	8
35.0 - 39.9	12
40.0 - 44.9	7
45.0 - 49.9	5
50.0 - 54.9	4
55.0 - 59.9	5
60.0 - 64.9	3

Apart from the question of comparability between areas, there is the additional problem of comparability for a given area from year to year. To a certain extent, time-trend studies would be facilitated if the International List were maintained without change over a long period of years. However, if the list were rigidly fixed it would soon be inconsistent with current medical terminology. To obtain the advantages of frequent revision, and yet to retain a fixed list for a number of years, revisions of the list are made at an international conference every 10 years. In the process of revision, some causes of death included under one title may be shifted to other titles. Since it is difficult to evaluate the numerical importance of all such rearrangements, definite discontinuities are introduced into the time trends of death rates for specific causes of death.

Improvement of diagnostic procedure and the development of medical knowledge and facilities are other important factors not to be overlooked in the study of changes in death rates for certain causes. For example, additional diagnostic cancer clinics located throughout the country may correctly diagnose many cancer deaths which might otherwise be classified in an unknown or ill-defined cause-group. Another example might be found in the case of syphilitic deaths. Deaths from this cause are not always correctly reported and the recent campaign to promote the treatment of this disease may also influence the accuracy of the reporting of syphilis on the death certificate.

NATALITY STATISTICS

Detailed tabulations of the live births registered in the United States in 1937 are given in general natality tables, numbers 1 to 7, inclusive. In these tables the reported births are classified by place of birth, sex and race of child, age and nativity of parents, order of birth, and other subjects. Additional information on birth statistics is included in the section on summary and rate tables. The following paragraphs point out some of the more important facts for 1937 and give comparable figures for past years.

TREND OF CRUDE BIRTH RATES.—In 1937 there were 2,203,337 registered births in the United States. With an estimated population of 129,257,000, the crude birth rate is 17.0 per 1,000 estimated population. The number of births reported for the United States birth-registration area and the crude birth rates for each year since 1915 are given in table F. This table also gives the estimated population of the United States, and the estimated population and percent of total included in the increasing birth-registration area.

An inspection of table F shows a rapid downward trend in the crude birth rate for more than 20 years. The rate for 1937 is slightly higher than that for 1936 or 1935, but the increase is so slight that it cannot be taken as an assurance that the direction of the trend has materially changed.

The trend of the birth rate, as shown in this table, is affected somewhat by the fact that the registration area included additional States from year to year and the more recently added States have, in general, higher birth rates than the original States. The additions to the area in various years are shown in table G. The effect of these newly added States on the rate for the area can be seen by comparing the trend of the rate for the original birth-registration area with the trend of the rate for the increasing area. The data for the original birth-registration area are given in table H. For this original area the rate decreased from 25.1 in 1915 to 15.6 in 1937, a decline of 37.8 percent. In the same period the rate for the whole area decreased from 25.1 to 17.0. The time trend of the rate for individual States is given in table VII in the section on summary and rate tables.

TABLE F.—CRUDE BIRTH RATES: BIRTH-REGISTRATION AREA, UNITED STATES

YEAR	Estimated midyear population of continental United States	BIRTH-REGISTRATION AREA			
		Estimated midyear population		Live births	
		Number	Percent of total	Number	Rate per 1,000 population
1937	129,257,000	129,257,000	100.0	2,203,337	17.0
1936	128,429,000	128,429,000	100.0	2,144,790	16.7
1935	127,521,000	127,521,000	100.0	2,155,105	16.9
1934	126,626,000	126,626,000	100.0	2,167,636	17.1
1933	125,770,000	125,770,000	100.0	2,081,232	16.5
1932	124,974,000	119,027,000	95.2	2,074,042	17.4
1931	124,113,000	117,522,000	94.7	2,112,760	18.0
1930	123,091,000	116,556,000	94.7	2,203,958	18.9
1929	121,526,429	115,097,972	94.7	2,169,920	18.9
1928	119,861,607	113,050,663	94.3	2,233,149	19.8
1927	118,196,785	103,575,656	87.6	2,137,836	20.6
1926	116,531,963	89,682,479	77.0	1,856,068	20.7
1925	114,867,141	87,486,096	76.2	1,878,880	21.5
1924	113,202,319	86,256,025	76.2	1,930,614	22.4
1923	111,537,497	80,694,406	72.3	1,792,646	22.2
1922	109,872,675	79,415,841	72.3	1,774,911	22.3
1921	108,207,853	70,738,177	65.4	1,714,261	24.2
1920	106,543,031	63,740,689	59.8	1,508,874	23.7
1919	105,003,065	61,483,423	58.6	1,373,438	22.3
1918	103,587,955	55,515,241	53.6	1,363,649	24.6
1917	102,172,845	54,771,416	53.6	1,353,792	24.7
1916	100,757,735	32,788,670	32.5	818,983	25.0
1915	99,342,625	30,936,179	31.1	776,304	25.1

TABLE G.—YEAR IN WHICH EACH STATE WAS ADMITTED TO THE BIRTH-REGISTRATION AREA

Year	State	Year	State	Year	State
1915--	Connecticut	1917--	Virginia	1925--	West Virginia
	Maine		Washington		
	Massachusetts		Wisconsin	1926--	Arizona
	Michigan				Idaho
	Minnesota	1919--	California		
	New Hampshire		Oregon	1927--	Alabama
	New York		South Carolina 3/		Arkansas
	Pennsylvania				Louisiana
	Rhode Island 1/	1920--	Nebraska		Missouri
	Vermont	1921--	Delaware		Tennessee
	Dist. of Columbia 2/		Mississippi		
			New Jersey	1928--	Colorado
1916--	Maryland				Georgia
		1922--	Illinois		Oklahoma
1917--	Indiana		Montana		
	Kansas		Wyoming	1929--	Nevada
	Kentucky				New Mexico
	North Carolina	1924--	Florida		
	Ohio		Iowa	1932--	South Dakota
	Utah		North Dakota	1933--	Texas

1/ Dropped from the birth-registration area in 1919; readmitted in 1921.
2/ Included in States.
3/ Dropped from the birth-registration area in 1925; readmitted in 1928.

TABLE H.—CRUDE BIRTH AND DEATH RATES: ORIGINAL BIRTH-REGISTRATION AREA, 1/ UNITED STATES

YEAR	Estimated midyear population	Live births	Total deaths 2/	RATE PER 1,000 POPULATION	
				Live births	Deaths 2/
1937	39,160,000	612,423	450,939	15.6	11.5
1936	39,008,000	602,931	451,391	15.5	11.6
1935	38,725,000	605,062	433,026	15.6	11.2
1934	38,438,000	602,101	434,205	15.7	11.3
1933	38,252,000	594,117	426,747	15.5	11.2
1932	38,078,000	631,467	428,350	16.6	11.2
1931	37,895,000	657,074	430,069	17.3	11.3
1930	37,666,000	694,433	432,479	18.4	11.5
1929	37,211,173	693,545	453,976	18.6	12.2
1928	36,704,193	719,569	450,564	19.6	12.3
1927	36,197,212	741,102	422,679	20.5	11.7
1926	35,690,232	735,708	453,386	20.6	12.7
1925	35,183,251	757,082	432,008	21.5	12.3

1/ Exclusive of Rhode Island. 2/ Exclusive of stillbirths.

In spite of the declining birth rate, as indicated, there was still an excess of more than 752,000 births over deaths in the United States in 1937. Even in the original birth-registration area, where the death rate is higher and the birth rate is lower than for the whole United States, there were 612,423 births compared with 450,939 deaths. Data on deaths in the original birth-registration area are included in table H in order to facilitate the comparison of rate trends. Table J gives the 1937 crude birth and death rates for each State.

TABLE J.—CRUDE BIRTH AND DEATH RATES: UNITED STATES AND EACH STATE, 1937

AREA	RATE PER 1,000 ESTIMATED MIDYEAR POPULATION		AREA	RATE PER 1,000 ESTIMATED MIDYEAR POPULATION

1/ Exclusive of stillbirths.

AGE OF PARENTS.—Careful analysis of the trend of birth rates or the comparison of rates between areas necessarily involves the consideration of age-specific birth rates. Such rates are not included in this volume, since accurate estimates of population by age, sex, and marital condition are not available for recent years. Certain detailed tabulations of births by age of father or age of mother are given in tables 3, 4, and 5.

Proportionate distributions of live births by age of mother for the years 1933 to 1937 are given in table K, and similar distributions by age of father are given in table L. Table M gives the proportionate distributions of age of father for each age-of-mother group. It is evident from each of these tables that there is an increasing tendency for a greater proportion of births to occur to parents in younger-age groups. Such changes could arise from differences in the rate of change of age-specific birth rates, from gradual changes in the age distribution of the population in the reproductive period of life, or from changes in the gross marriage rate or the distribution of age at marriage.

It is unfortunate that there are no national statistics on marriage and divorce to which birth statistics could be related.

TABLE K.—DISTRIBUTION OF LIVE BIRTHS, PER 1,000, BY AGE OF MOTHER: UNITED STATES

AGE OF MOTHER	1937	1936	1935	1934	1933
All ages	1,000.0	1,000.0	1,000.0	1,000.0	1,000.0

1/ Less than one-tenth of 1 per 1,000 live births.

PLURAL BIRTHS.—The great majority of births registered each year are single births. Of the total of 2,203,337 live births in 1937, there were 2,154,719 single births. In addition to these there were 24,881 cases of twins, 219 cases of triplets, and 4 cases of quadruplets

The proportion of plural birth cases to the total number of cases of birth remains fairly constant from year to year. In 1937 there were 11.5 cases of plural births per 1,000 total cases. The highest proportion of plural births was recorded in 1919 when the ratio was 12.2 cases per 1,000. After 1919 the ratio fluctuated between 11.2 and 11.9.

The total number of cases of live births, the cases of single births, and the cases of twins, triplets, and quadruplets are given for the birth-registration area in table N. An authentic case of quintuplets in the United States has never been reported during the time that the Bureau of the Census has been compiling annual birth data.

TABLE N.—CASES OF LIVE BIRTHS: BIRTH-REGISTRATION AREA, UNITED STATES

YEAR	Total cases	Cases of single births	CASES 1/ OF PLURAL BIRTHS				Cases 1/ of plural births per 1,000 total cases
			Total	Twins	Triplets	Quadruplets	
1937	2,179,823	2,154,719	25,104	24,881	219	4	11.5

1923	1,773,105	1,752,331	20,775	20,594	179	2	11.7
1922	1,755,561	1,735,074	20,487	20,284	199	4	11.7
1921	1,695,127	1,674,875	20,252	20,021	230	1	11.9
1920	1,492,532	1,475,113	17,419	17,229	184	6	11.7
1919	1,357,737	1,341,234	16,503	16,316	186	1	12.2
1918	1,349,015	1,333,526	15,489	15,342	147	-------	11.5
1917	1,339,975	1,325,426	14,549	14,394	155	-------	10.9
1916	811,119	802,892	8,227	8,139	86	2	10.1
1915	768,887	761,150	7,737	7,673	64	-------	10.1

1/ Includes only those cases in which at least one was a live birth.

AVERAGE NUMBER OF CHILDREN.—Table O is a tabulation of the average number of children ever born to women who bore children, in each specified year. These averages are given for the years 1928 to 1937. In 1928 and 1929 the average number of children ever born was 3.2. This figure has gradually declined to 2.9 in 1936 and 2.8 in 1937. The decrease in the average number of children is probably an indication of declining fertility. This interpretation is strengthened by the fact that there is a decrease in the average number of children for almost every age-of-mother group. The figures given cannot be directly interpreted as the average size of family in the whole population, inasmuch as only those mothers who gave birth during the current year are included. Moreover, the average for all ages is affected by changes in the marriage rate or in the average age at marriage, as well as by other factors. Thus, if a rapid increase in the marriage rate increased the proportion of first births, the average number of children would be decreased. This decrease would then be occurring at the same time that the reproductive rate of certain age groups would be increasing.

TABLE O.—AVERAGE NUMBER OF CHILDREN EVER BORN TO WOMEN WHO BORE CHILDREN IN SPECIFIED YEARS: BIRTH-REGISTRATION AREA, 1/ UNITED STATES

AGE OF MOTHER	AVERAGE NUMBER OF CHILDREN IN—									
	1937	1936	1935	1934	1933	1932	1931	1930	1929	1928

1/ Exclusive of Colorado, Maine, Massachusetts, New Hampshire, and Rhode Island from 1928 to 1932; exclusive of Colorado, Massachusetts, and New Hampshire in 1933; exclusive of Massachusetts and New Hampshire from 1934 to 1937.

ILLEGITIMATE BIRTHS.—The number of illegitimate births and the rate per 1,000 total live births is given in table P. In 1937 there were 74,938 births reported as illegitimate, and the rate was 40.2 per 1,000 live births. This is the highest rate for illegitimacy recorded for the registration area since these data were first available in 1917. In that first year the rate was 20.2 and there was a steady increase in the years following. The trend of this rate is somewhat influenced by the changing character of the registration area from year to year. The rate for races other than white is very high, and the addition to the registration area of States with a high proportion of Negroes has accelerated the upward trend of the total rate. However, for the white group alone, there has been a marked increase in the proportion of recorded illegitimate births. In 1917 the rate for the white group in the registration area was 13.0 and in 1937 the rate was 20.1.

TABLE P.—ILLEGITIMATE LIVE BIRTHS BY RACE: BIRTH-REGISTRATION AREA, 1/ UNITED STATES

YEAR	ILLEGITIMATE LIVE BIRTHS					
	Number			Rate per 1,000 total live births		
	Total	White	All other races	Total	White	All other races
1937	74,938	32,231	42,707	40.2	20.1	163.9

1919	23,660	12,360	11,300	23.6	13.6	121.9
1918	19,905	12,000	7,906	19.4	12.5	113.8
1917	20,464	12,238	8,226	20.2	13.0	120.1

1/ Exclusive of California, Massachusetts, and New York. These States do not require a statement concerning legitimacy of child.

NOTE.—Data not available for the years 1915 and 1916.

Data on illegitimate births for 1935, 1936, and 1937 for individual States are given in table Q. This table gives the number of illegitimate births and the rate for each State, for "white" and "all other races." California, Massachusetts, and New York are not included in this table as the birth certificates for these States do not require a statement concerning legitimacy. It must be recognized that the reporting of the fact of illegitimacy in other States is probably incomplete and inaccurate.

TABLE Q.—ILLEGITIMATE LIVE BIRTHS BY RACE: UNITED STATES 1/ AND EACH STATE

AREA AND RACE	ILLEGITIMATE LIVE BIRTHS					
	Number			Per 1,000 total live births

REPORTING OF STILLBIRTHS.—Information on stillbirths was first collected by the Bureau of the Census in 1918. No data were collected or published for the years 1919 to 1921, inclusive, but since 1922 stillbirth tables have been compiled annually for the birth-registration area.

In some States stillbirths are reported on a single stillbirth certificate, whereas in others, State laws require the physician or attendant at a stillbirth to file both a birth and a death certificate. Such basic differences in reporting procedure introduce some variation in the completeness of registration and in the information reported. More important, from a statistical standpoint, are differences in the legal definitions of a stillbirth used in the States. Variations in the definition make it impossible to compile strictly comparable data for all States, and confuse the interpretation of consolidated national figures. A list showing the various definitions used in reporting stillbirths has been published each year before 1937 in the volume entitled "Birth, Stillbirth, and Infant Mortality Statistics." More recent data on stillbirth definitions for each State are given in Vital Statistics—Special Reports, vol. 3, No. 2, table 13. Neither of these

sources of definitions can be considered up-to-date, since changes may occasionally be made in State procedures. It is expected that the adoption of a standard stillbirth certificate in 1940 will make these data more complete and uniform.

Detailed tables classifying stillbirths by area, race, age of mother, nativity of parents, and other subjects, are given in tables 8, 9, and 10 in the section on general natality tables.

The total number of stillbirths and the ratio of stillbirths to each 1,000 live births are given in table R for the birth-registration area for a series of years.

The ratio of stillbirths to live births for the first year that these data are available (1918) is 40.1. For the years 1922 to 1930 the ratio varied around 38, 39, and 40, without demonstrating any appreciable trend. However, since 1930 the ratio has been consistently decreasing, and for 1937 is 33.4, which is 14.8 percent below the rate for 1930. This decrease in recent years cannot be attributed to changes in the registration area, because the area has included the whole United States since 1933.

TABLE R.—RATIO OF STILLBIRTHS TO LIVE BIRTHS: BIRTH-REGISTRATION AREA, UNITED STATES

YEAR	Live births	STILLBIRTHS		YEAR	Live births	STILLBIRTHS	
		Number	Rate per 1,000 live births			Number	Rate per 1,000 live births
1937	2,203,337	73,609	33.4	1928	2,233,149	89,765	40.2
1936	2,144,790	73,735	34.4	1927	2,137,836	82,931	38.8
1935	2,155,105	77,119	35.8	1926	1,856,068	70,716	38.1
1934	2,167,636	78,503	36.2	1925	1,878,880	71,519	38.1
1933	2,081,232	77,059	37.0	1924	1,930,614	75,817	39.3

1930	2,203,958	86,466	39.2	1918	1/ 1,211,685	1/ 48,634	1/ 40.1
1929	2,169,920	85,678	39.5				

1/ Exclusive of Massachusetts, Rhode Island, Washington, and Baltimore, Maryland. No transcripts of stillbirths were received from these areas.

NOTE.—Data relating to stillbirths were not collected for the years 1919 to 1921, inclusive.

ILLEGITIMATE STILLBIRTHS.—The number of stillbirths reported as legitimate or illegitimate is shown in table S. As may be expected, the stillbirth rate for illegitimate births is higher than the stillbirth rate for legitimate births. Data in table S are for the years 1933 to 1937 for "white" and "all other races." California, Massachusetts, and New York are not included in this table.

TABLE S.—STILLBIRTHS BY LEGITIMACY AND RACE: UNITED STATES 1/

YEAR AND RACE	STILLBIRTHS					
	Number			Rate per 1,000 live births

1/ Exclusive of California, Massachusetts, and New York. These States do not require a statement concerning legitimacy of child.
2/ Data not available.

MORTALITY STATISTICS

Detailed tables classifying deaths in the United States for 1937, by place of death, age, sex, race, cause of death, and other subjects, are given in the section on general mortality statistics, tables 11 to 21. In addition to these detailed tables, selected data for deaths are included in the summary and rate tables. Special tables for deaths of infants are given in the section on general infant-mortality tables.

DEATH RATE TREND.—In 1937 there were 1,450,427 registered deaths in the United States. Using an estimated midyear population of 129,257,000, the crude death rate is 11.2 per 1,000. This rate, though slightly lower than the rate for 1936, is not greatly different from those for the past several years. In 1900, the first year for which annual mortality statistics were compiled, the crude death rate was 17.6. The trend of the rate since that year has been generally downward, although there has been an occasional year of high mortality. The lowest death rate for this period of time is for 1933, for which year the rate is 10.7.

Table T, giving the number of deaths and the death rate for each year, shows also the estimated population of the United States and the proportion of it that is included in the death-registration area. The States which were added in various years are indicated in table U. Even though the succession of rates in table T does not refer to a strictly comparable geographic area, the consistent downward trend of the rate is not misleading. Essentially the same trend is evident in table H for a constant geographic area. Although there is considerable variation in the level of the rate, similar trends for individual States are shown in table IX.

TABLE T.—CRUDE DEATH RATES: DEATH-REGISTRATION AREA, UNITED STATES

YEAR	Estimated midyear population of continental United States	DEATH-REGISTRATION AREA			
		Estimated midyear population		Total deaths 1/	
		Number	Percent of total	Number	Rate per 1,000 population
1937	129,257,000	129,257,000	100.0	1,450,427	11.2

	Wisconsin		Mississippi	1933--	Texas

1/ Included in States.
2/ Dropped from the registration area in 1900; readmitted in 1919.
3/ Dropped from the registration area in 1910; readmitted in 1930.
4/ Included only municipalities with populations of 1,000 or more in 1900 (about 16 percent of the total population); the remainder of the State was added to the area in 1916.
5/ Dropped from the registration area in 1925; readmitted in 1928.

DEATHS BY AGE.—Age distributions by sex, race, and cause of death, are included in several of the general mortality tables. A brief summary of these distributions is given in table W, which shows the total number of deaths in the United States in 1937, classified by age and sex. This table includes also the proportionate age distribution of deaths by sex. Similar distributions for total deaths are given in table Y for the years 1933 to 1937. It can be observed that a smaller proportion of deaths are occurring at younger years. In each of the age groups under 45 years there was a smaller proportion of the total deaths in 1937 than in 1933, whereas in most of the groups over 45, the proportion increased. While, to a certain extent, this is an indication of changing age-specific death rates, such as the decrease in infant mortality, it is primarily a result of the gradual aging of the population exposed to the risk of death. Inasmuch as accurate population estimates by age are not available, age-specific death rates have not been computed.

TABLE W.—DISTRIBUTION OF DEATHS, 1/ PER 1,000, BY AGE AND SEX: UNITED STATES, 1937

AGE	DEATHS 1/					
	Number			Distribution per 1,000		
	Total	Male	Female	Total	Male	Female

DEATH RATES BY MONTH.—Table Z gives the crude death rate by month for the United States for the years 1933 to 1937. Death rates are consistently low in the months of August and September, whereas the highest rates are for the first 3 months of the year. For 1937, the highest rate occurred in February, when the rate was 13.8. This high rate, as well as the generally high rates for the winter months, results for the most part from an increase in the number of deaths from respiratory causes. A tabulation of deaths from selected causes by month is given in table 21.

TABLE Z.—ANNUAL CRUDE DEATH RATES 1/ PER 1,000 ESTIMATED MIDYEAR POPULATION, BY MONTH: UNITED STATES

MONTH	1937	1936	1935	1934	1933	MONTH	1937	1936	1935	1934	1933
Total	11.2	11.5	10.9	11.0	10.7	June	10.2	10.7	10.3	10.6	10.4

DEATHS BY RACE.—Table AA is a classification of deaths by race and sex. Out of the total of 1,450,427 deaths in 1937, 1,254,787 or 86.5 percent were classified as white. Negro deaths numbered 187,594 or 12.9 percent. The number of deaths reported for Indian, Chinese, Japanese, and other numerically minor races, totaled 8,046 or less than 1 percent of all deaths.

TABLE AA.—DISTRIBUTION OF DEATHS, 1/ PER 1,000, BY RACE AND SEX: UNITED STATES, 1937

RACE	DEATHS 1/					
	Number			Distribution per 1,000		
	Total	Male	Female	Total	Male	Female
All races	1,450,427	808,834	641,593	1,000.0	1,000.0	1,000.0
White	1,254,787	702,630	552,157	865.1	868.7	860.6

DEATH RATES FOR SELECTED CAUSES OF DEATH.—Tabulations of deaths by cause and other classifications are given in general mortality tables, numbers 14 to 21, inclusive. The number of deaths in the United States in 1937 and the crude death rate for each International List title and subdivision are given in table XI. Death rates for selected causes are tabulated in table XII for each State.

The trend in death rates for specific causes, over the past 20 or 30 years, may be characterized by two general statements. In the first place, there has been a great reduction in the death rates for infectious and preventable diseases; in the second place, there has been an increase in the rates for certain diseases characteristic of older ages. Greatest proportional rate decreases have taken place for such diseases as typhoid and paratyphoid fever, which has declined from a rate of 23.5 in 1910 to 2.1 in 1937; and diphtheria, which declined from a rate of 21.4 in 1910 to 2.0 in 1937. These rates, and those following, are for the changing death-registration area. Greater absolute reductions, though smaller proportionate reductions, have been made for other important causes. The death rate for diarrhea and enteritis has shown a remarkable decrease from 117.4 in 1910 to 14.6 in 1937, and that for tuberculosis of the respiratory system has been reduced from 136.0 in 1910 to 49.0 in 1937. The trend of the rate for influenza and pneumonia is more irregular. The rate for this cause was 162.1 per 100,000 estimated population in 1910. In the following 5 years this rate decreased somewhat, but during the influenza epidemic of 1918, it increased to the extremely high rate of 587.0. In that year more than 1 out of every 200 living persons died from influenza and pneumonia. Since 1930 the rate has in general been lower than during the decade 1920 to 1929.

For certain diseases characteristic of older ages, the most notable increase is in the rate for cancers and other malignant tumors. The crude death rate for cancer, for the registration area in 1910, was 76.2 per 100,000 estimated population. This rate has gradually increased to 112.0 in 1937. Even this change in rate does not fully indicate the large increase in deaths reported from cancer. The addition to the registration area of States with younger populations has tended to minimize the increase that would be observed in a geographically constant area. For example, while the cancer death rate for the growing registration area increased from 76.2 in 1910 to 97.3 in 1930, the rate for the registration States of 1900 increased from 83.0 to 117.9 in the same interval.

A large increase in rate is also noticeable for diseases of the heart. The rate of 158.8 in 1910 increased to 222.3 in 1937. Here again the full significance of this increase is not evident when only data for the changing registration area are considered.

The rate reductions for infectious and preventable diseases can be largely attributed to the development of modern public-health practice. The increases from such causes as cancer and heart diseases are doubtless due to several reasons. The decrease in deaths from diseases of infancy and childhood, along with the decline in the birth rate, is producing in the United States a population with a higher proportion of persons in the older-age groups. This fact in itself tends to increase the total death rates for diseases associated primarily with advanced age. Also, there is little doubt but that improved diagnostic facilities and increasing hospitalization have increased the number of deaths charged to cancer, as well as to certain other types of disease. An accurate determination of the change in mortality for these causes requires a careful study in which the age composition of the population and other pertinent factors are considered.

Crude rates for selected causes of death for the increasing registration area for each year from 1910 to 1937 are given in table AB.

TABLE AB.—DEATH RATES 1/ PER 100,000 ESTIMATED MIDYEAR POPULATION FOR SELECTED CAUSES: DEATH-REGISTRATION AREA, UNITED STATES

(Numbers after causes of death are those of the 1929 revision of the detailed International List)

CAUSE OF DEATH	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923

1/ Exclusive of stillbirths. 2/ Including capillary bronchitis. 3/ Excluding diseases of coronary arteries.
4/ Including ulcer of the duodenum from 1910 to 1920. 5/ Excluding adhesions of intestines from 1910 to 1920. 6/ Not separately tabulated.
7/ Exclusive of accidents associated with automobiles (206,208,210). 8/ Less than one-tenth of 1 per 100,000 population.

INFANT MORTALITY STATISTICS

Detailed tables for infant mortality are given in the section on general infant-mortality tables. Rates for individual States for a series of years are given in rate table X; and the number of infant deaths and death rates for each city and county are included in table XIII.

TREND OF INFANT MORTALITY.—In 1937 there were 119,931 infant deaths registered in the United States. This is the smallest number of infant deaths reported since the birth-registration area was completed in 1933. This reduced number of deaths, taken with an increased number of births in 1937, results in an infant death rate of 54.4 (number of deaths under 1 year of age per 1,000 live births) which is the lowest infant death rate ever recorded for the registration area. Rates for each year, together with the number of infant deaths and the number of live births, are given in table AC. These data are presented for the birth-registration area, inasmuch as the infant mortality rate is computed on the number of live births. The number of infant deaths for the death-registration area can be found in general mortality tables classified by age.

The infant mortality rate was 99.9 in 1915, and twice thereafter (in 1916 and 1918) the rate exceeded 100.0. Since 1918 there has been a steady and rapid decrease in infant mortality. The 1937 rate of 54.4 is only 54.5 percent of the rate for 1915.

The reduction in infant mortality has occurred in both the "white" and "Negro" classifications as shown in table AD. Although the rate for Negroes is considerably higher than that for the "white," the proportionate reduction over the last 18 years has been greater. The data in table AD for "other races" is based on relatively few deaths and the rate is therefore quite variable.

INFANT DEATH RATES BY AGE.—Death rates for infants at various ages during the first year of life are given in table AE. These data are given for the birth-registration area for each

TABLE AC.—INFANT MORTALITY: BIRTH-REGISTRATION AREA, UNITED STATES

YEAR	Live births	DEATHS UNDER 1 YEAR 1/ Number	DEATHS UNDER 1 YEAR 1/ Rate per 1,000 live births	YEAR	Live births	DEATHS UNDER 1 YEAR 1/ Number	DEATHS UNDER 1 YEAR 1/ Rate per 1,000 live births

1927	64.6	60.6	99.9	103.4	1915	99.9	98.6	180.6	196.2
1926	73.3	70.0	112.1	108.9					

1/ Exclusive of stillbirths.

year beginning with 1924. The most notable feature of this table is that, although reductions in rate have been made for almost every age-group, little or no reduction has been made in the rate for under 1 day. For each year included in table AE, the rate for deaths under 1 day has been approximately 15.0 per 1,000 live births. While this rate has remained practically constant, the total infant rate has decreased from 70.8 in 1924 to 54.4 in 1937, and the rate for infant deaths over 1 month has decreased from 32.2 to 23.2.

TABLE AE.--INFANT MORTALITY RATES (DEATHS 1/ UNDER 1 YEAR PER 1,000 LIVE BIRTHS) BY AGE: BIRTH-REGISTRATION AREA, UNITED STATES

1/ Exclusive of stillbirths.
2/ For birth-registration area, 116,556,000; for death-registration area, 118,472,000.
3/ For birth-registration area, 87,486,096; for death-registration area, 102,951,999.
4/ For birth-registration area, 63,740,689; for death-registration area, 87,652,592.
5/ Data not available.

Note.---For errata in tables V and VI and for more extensive tabulations, see Vital Statistics---Special Reports, vol. [illegible], no. [illegible], 1940.

TABLE VII.—CRUDE BIRTH RATES (NUMBER OF LIVE BIRTHS PER 1,000 ESTIMATED MIDYEAR POPULATION): UNITED STATES, EACH DIVISION AND STATE, 1915-1937

(For each State, rates are shown from the year of its admission to the birth-registration area; for each geographic division, rates are shown from the year when the division, as a whole, became a part of the birth-registration area)

DIVISION AND STATE	1915	1916	1917	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927	1928	1929	1930	1931	1932	1933	1934	1935	1936	1937

1/ South Carolina was dropped from the birth-registration area in 1925, readmitted in 1928.

TABLE IX.—CRUDE DEATH RATES (NUMBER OF DEATHS PER 1,000 ESTIMATED MIDYEAR POPULATION): UNITED STATES, EACH DIVISION AND STATE, 1915-1937

(Exclusive of stillbirths. For each State, rates are shown from the year of its admission to the death-registration area; for each geographic division, rates are shown from the year when the division, as a whole, became a part of the death-registration area)

DIVISION AND STATE	1915	1916	1917	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927	1928	1929	1930	1931	1932	1933	1934	1935	1936	1937

	(e) Other diseases of the thyroid and parathyroid glands	94	134	0.1	0.1
67	Diseases of the thymus gland	1,319	1,272	1.0	1.0
68	Diseases of the adrenals (Addison's disease, not specified as tuberculous)	349	413	0.3	0.3
69	Other general diseases	442	534	0.3	0.4

1/ Less than one-tenth of 1 per 100,000 estimated population. 2/ Not separately tabulated.

TABLE XI.—DEATHS FROM EACH CAUSE AND CRUDE DEATH RATES: UNITED STATES, 1936 AND 1937—Continued

(See note at head of this table)

List No.	CAUSE OF DEATH	DEATHS IN THE UNITED STATES			
		Number		Rate per 100,000 estimated population	
		1937	1936	1937	1936
	IV.—Diseases of the blood and blood-making organs	10,495	10,396	8.1	8.1
70	Hemorrhagic conditions	720	729	0.6	0.6
	(a) Primary purpuras	528	511	0.4	0.4
	(b) Hemophilia	192	218	0.1	0.2
71	Anemias	3,406	3,754	2.6	2.9
	(a) Pernicious anemia	2,901	3,155	2.2	2.5
	(b) Other anemias	505	599	0.4	0.5
72	Leukemias and pseudoleukemias	5,810	5,325	4.5	4.1
	(a) True leukemias	3,899	3,628	3.0	2.8
	(b) Pseudoleukemias (Hodgkin's disease)	1,911	1,697	1.5	1.3
73	Diseases of the spleen	392	430	0.3	0.3
74	Other diseases of the blood and blood-making organs	167	158	0.1	0.1
	V.—Chronic poisonings and intoxications	3,509	3,966	2.7	3.1
75	Alcoholism (acute or chronic)	3,305	3,714	2.6	2.9
76	Chronic poisoning by other organic substances	105	99	0.1	0.1
	(a) Occupational	13	9	1/	1/
	(b) Other chronic poisoning by organic substances	92	90	0.1	0.1
77	Chronic poisoning by mineral substances	99	153	0.1	0.1
	(a) Lead	77	132	0.1	0.1
	(b) Occupational (except lead)	11	8	1/	1/
	(c) Other chronic poisoning by mineral substances	11	13	1/	1/
	VI.—Diseases of the nervous system and of the organs of special sense	136,253	143,543	105.4	111.8
78	Encephalitis (nonepidemic)	1,483	1,623	1.1	1.3
79	Meningitis	2,756	2,945	2.1	2.3
	(a) Simple meningitis	2,359	2,530	1.8	2.0
	(b) Nonepidemic cerebrospinal meningitis	397	415	0.3	0.3
80	Progressive locomotor ataxia(tabes dorsalis)	895	1,005	0.7	0.8
81	Other diseases of the spinal cord	3,008	3,206	2.3	2.5
82	Cerebral hemorrhage, cerebral embolism and thrombosis	111,753	116,562	86.5	90.8
	(a) Cerebral hemorrhage	98,852	103,560	76.5	80.6
	(b) Cerebral embolism and thrombosis	8,470	8,456	6.6	6.6
	(c) Softening of the brain	725	774	0.6	0.6
	(d) Hemiplegia and other paralysis, cause unspecified	3,706	3,772	2.9	2.9
83	General paralysis of the insane	4,160	4,448	3.2	3.5
84	Dementia praecox and other psychoses	1,576	1,678	1.2	1.3
85	Epilepsy	2,710	2,844	2.1	2.2
86	Convulsions (under 5 years of age)	639	733	0.5	0.6
87	Other diseases of the nervous system	3,773	4,155	2.9	3.2
	(a) Neuralgia and neuritis	176	197	0.1	0.2
	(b) Other diseases of the nervous system	3,597	3,958	2.8	3.1
88	Diseases of the organs of vision	57	73	1/	0.1
89	Diseases of the ear and of the mastoid process	3,443	4,271	2.7	3.3
	(a) Diseases of the ear	2,190	2,643	1.7	2.1
	(b) Diseases of the mastoid process	1,253	1,628	1.0	1.3
	VII.—Diseases of the circulatory system	375,582	371,675	290.6	289.4
90	Pericarditis	659	759	0.5	0.6
	(A) Chronic rheumatic pericarditis	13	2/	1/	2/
	(B) Others under this title	646	2/	0.5	2/
91	Acute endocarditis	3,189	3,474	2.5	2.7
	(a) Specified as acute	2,738	2,951	2.1	2.3
	(b) Unspecified (under 45 years of age)	451	523	0.3	0.4
92	Chronic endocarditis, valvular diseases 3/	50,307	54,449	38.9	42.4
	(A) Endocarditis, specified as chronic, and other valvular diseases	43,660	50,529	33.8	39.3
	(B) Endocarditis, unspecified (45 years and over)	3,415	3,920	2.6	3.1
	(C) Chronic rheumatic valvular diseases including chronic rheumatic endocarditis	3,232	2/	2.5	2/
93	Diseases of the myocardium 3/	148,796	149,123	115.1	116.1
	(A) Acute myocarditis	4,742	5,086	3.7	4.0
	(B) Myocarditis, unspecified (under 45 years of age)	960	1,062	0.7	0.8
	(C) Chronic myocarditis and myocardial degeneration	110,956	110,654	85.8	86.2
	(D) Unspecified	31,781	32,321	24.6	25.2
	(E) Chronic rheumatic myocarditis	357	2/	0.3	2/
94	Diseases of the coronary arteries and angina pectoris	69,758	66,382	54.0	51.7
	(a) Angina pectoris	10,639	17,760	8.2	13.8
	(b) Diseases of the coronary arteries	59,119	48,622	45.7	37.9
95	Other diseases of the heart 3/	73,692	67,163	57.0	52.3
	(A) Functional diseases of the heart	881	856	0.7	0.7
	(B) Other and unspecified	68,959	66,307	53.4	51.6
	(C) Rheumatic heart disease	3,852	2/	3.0	2/
96	Aneurysm (except of the heart)	2,526	2,636	2.0	2.1
97	Arteriosclerosis (diseases of the coronary arteries excepted)	22,048	22,965	17.1	17.9
98	Gangrene	693	893	0.5	0.7
99	Other diseases of the arteries	1,750	1,679	1.4	1.3
100	Diseases of the veins (varices, hemorrhoids, phlebitis, etc.)	771	771	0.6	0.6
101	Diseases of the lymphatic system (lymphangitis, etc.)	115	165	0.1	0.1
102	Idiopathic anomalies of the blood-pressure	1,011	928	0.8	0.7
103	Other diseases of the circulatory system	267	288	0.2	0.2
	VIII.—Diseases of the respiratory system	124,581	134,920	96.4	105.1
104	Diseases of the nasal fossae and annexa	998	1,112	0.8	0.9
	(a) Diseases of the nasal fossae	381	364	0.3	0.3
	(b) Others under this title	617	748	0.5	0.6

1/ A minus sign (-) indicates an excess of deaths over births.
2/ Rate is not computed when the number of deaths is less than 100.
3/ Rates over 300 are not shown.
4/ Includes only data for Texarkana, Ark.
5/ Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures and rates for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Elwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.
6/ Includes only data for Bristol, Tenn.
7/ Includes only data for Texarkana, Tex.
8/ Cities of Virginia are independent, each having the same status as a county. Cities having populations of 10,000 or more include: Charlottesville, Alexandria, Staunton, Lynchburg, Petersburg, Winchester, Richmond, Suffolk, Norfolk, Portsmouth, Danville, Hopewell, Roanoke, and Newport News.
9/ Includes only data for Bristol, Va.
10/ Includes only data for Bluefield, W. Va.

GENERAL NATALITY AND MORTALITY TABLES
