

1994 National Health Interview Survey (NHIS)  
Year 2000 Objectives Public Use Data File

1. The 1994 National Health Interview Survey (NHIS) Year 2000 data file contains data items on 7 selected topic areas which relate to the Department's (HHS) Year 2000 Health objectives. The specific Year 2000 questionnaire topics and file locations are listed below:

Section	File Location:
A Environmental Health	336-365
B Tobacco	366-400
C Occupational Safety and Health	401-510
D Heart Disease	511-535
E Clinical and Preventive Services	536-570
F Family	571-585
G Firearms*	586-621

\* Analysts interested in Firearms data are encouraged to review this section of the questionnaire. The information on presence or absence of firearms in the household was collected from one randomly selected adult per family. Data from persons who live in households with more than one family should be interpreted with caution.

2. The 1994 Year 2000 topic areas were administered to one adult sample person per family in half of the households in the 1994 sample. The other half of the households were administered the AIDS supplement.

The 1994 Year 2000 file is structured in the following way:

- a. The NHIS person record from the core questionnaire (locations 1-200)
  - b. Weight fields (locations 201-212)
  - c. The special topic data (locations 336-621)
3. In 1994, two types of item non-response were identified:
    - (1) "Not ascertained" (codes 8, 98, or 998) includes blanks when there should have been a response or when an impossible code appeared and;
    - (2) Responses of "don't know" or "refused" when the question was asked (codes 9, 99 and 999).

For some items, it was determined that there was no meaningful difference between "not ascertained" and "don't know" or "refused". In these cases, the two categories were both coded 9 (or 99 or 999, as appropriate) and labeled "Unknown"

1

YRPUB - 2

NOTE: When "unknown" is used in an NA or Not applicable label it refers to the collective not ascertained and DK, refused

4. The overall response rate for the 1994 Year 2000 was 79.5

percent. This response rate was calculated as follows:

Household response rate from core (94.1 percent)  
multiplied by 84.5 percent who responded to the Year 2000  
yielding an overall response rate of 79.5 percent.

5. Weights and variances:

Since the NHIS uses a multistage sample design to represent the civilian non-institutionalized population of the United States, weights must be used to make accurate estimates based on data from the National Health Interview Survey. Two weights are included on the 1994 file:

The first weight listed below (i.e. the Year 2000 Final Basic Weight) will be used in most analyses of the Year 2000 data.

The Year 2000 Final Basic Weight differs from that calculated for the Core data file in that the Year 2000 sample was re-weighted to account for non-response and the selection of only one adult per family.

This weight will be used in conjunction with Year 2000 data items in file locations 336-621.

Interim Basic Weights (before age-sex-race adjustment) are required by some software packages for variance estimation for surveys with complex sample designs. This weight is also included on the file.

There are a number of computer programs that yield variance estimates for data based on complex sample surveys. Some are based on replication approaches and others are based on Taylor linearization approaches. In addition to the Interim Basic Weight (which is the weight prior to poststratification), included on the Year 2000 file is the Full Sample Stratum Identifier (loc. 179-181), the Pseudo Primary Sampling Unit (PSU) Codes (loc. 187-189), and the Type of PSU (loc. 185) to permit the analyst the capability of using such variance estimation procedures. These variables and weights are necessary for directly calculating sampling variances.

6. Estimating annual numbers of events or conditions

- a. To reduce respondent error, the recall period for questions about some events is limited to two weeks. These events are: bed days and other restricted activity

1

YRPUB - 3

days, work loss and school loss days, and doctor visits. The two-week variables are found in locations 98-107 and 120-121. Estimates of the total number of occurrences of these events in the population can be derived as follows:

$$\begin{aligned} & \text{Number of events} \times 26 \text{ (number of two-week} \\ & \text{periods in a year)} \times \text{Final Basic Weight} \\ & = \text{Total number of events occurring in the} \\ & \text{population during the annual period,} \\ & \text{i.e. 1994.} \end{aligned}$$

Example: Number of bed days (loc. 100-101) x 26 x Final Basic Weight (loc. 207-212) = total number of bed days reported for the population in 1994.

- b. The recall period for acute incidence conditions is also two weeks and a national estimate of the total number of acute incidence conditions is calculated using the same procedures as for two-week events for the semi-annual period.

Number of acute incidence conditions x 26 x Final Basic Weight

= Total number of acute incidence conditions occurring in the population during 1994.

Note: An acute incidence condition is an acute condition with onset during the two weeks preceding the date of interview.

- c. The recall period for information on hospitalizations is 12 months. However, in calculating number of discharges (locations 132-133, 137-138), only discharges occurring in the past 6 months are counted. Therefore, the weighted estimates must be calculated as follows:

Number of discharges x 2 x Final Basic Weight

= Total number of discharges occurring in the population in 1994.

7. Calculation of rates for events and conditions:

The number of events or conditions estimated for the population, as described in item 6, above, can be used as the basis for calculating rates of occurrence of these events (or conditions) per person and per 100 persons for the total U.S. population and for various population subgroups.

1

YRPUB - 4

Note: Only rates can be estimated from these data. The percent of the population experiencing a particular type of event during the data year cannot be estimated. {The percent of the population experiencing the event in the reporting period (i.e. two weeks or 6 months) can be estimated but is generally not meaningful.}

- 8. Data on hospital episodes and days, based on a 12-month recall are in locations 122-131. The Final Basic Weight is used for calculating estimates of these events in the same way it is used for all other person-based variables. These variables do permit estimating the percent of the population in this annual period experiencing a hospital episode in the past year and the percent of that population having a specified number of hospital days.

9. Guidelines for Citation of Data

With the goal of mutual benefit, the National Center for

Health Statistics (NCHS) requests that recipients of data files cooperate in certain actions related to their use.

Any published material derived from the data should acknowledge NCHS as the original source. The suggested citation to appear at the bottom of all tables is as follows:

Source: National Center for Health Statistics (1994)

When cited in a bibliography, the suggested citation should read:

National Center for Health Statistics (1996). Data File Documentation, National Health Interview Survey of Topics Related to the Year 2000 Health Objectives, 1994 (machine readable data file and documentation), National Center for Health Statistics, Hyattsville, Maryland

The published material should also include a disclaimer that credits any analyses, interpretations, or conclusions reached to the author (recipient of the data file) and not to NCHS, which is responsible only for the initial data. Consumers who wish to publish a technical description of the data should make a reasonable effort to insure that the description is not inconsistent with that published by NCHS.
