HEALTH STATISTICS

FROM THE U.S. NATIONAL HEALTH SURVEY

Acute Conditions seasonal variations

United States

July 1957 - June 1961

Statistics on incidence of acute conditions and number of associated days of disability in each calendar quarter according to condition group and age. Based on data collected in household interviews during the period July 1957-June 1961.

The U. S. National Health Survey is a continuing program under which the Public Health Service makes studies to determine the extent of illness and disability in the population of the United States and to gather related information. It is authorized by Public Law 652, 84th Congress.

CO-OPERATION OF THE BUREAU OF THE CENSUS

Under the legislation establishing the National Health Survey, the Public Health Service is authorized to use, insofar as possible, the services or facilities of other Federal, State, or private agencies.

In accordance with specifications established by the National Health Survey, the Bureau of the Census, under a contractual arrangement, participates in most aspects of survey planning, selects the sample, collects the data, and carries out certain parts of the statistical processing.

ACUTE CONDITIONS

SEASONAL VARIATIONS

INTRODUCTION

During the 16 calendar quarters from July 1957-June 1961 an estimated average of 95 million acute conditions per quarter involving either activity restriction or medical attention were experienced by members of the civilian, noninstitutional population of the United States. This estimate is based on data collected in household interviews conducted by the U. S. National Health Survey, National Center for Health Statistics. The largest number of acute conditions occurring in any quarter was 160 million conditions in October-December 1957, the peak of the epidemic of Asian influenza. The smallest estimated number of acute conditions was the 60 million cases which occurred in July-September 1959.

The average of 95 million acute conditions per quarter resulted in restriction of activity for the average person of 2.3 days per quarter. The largest number of restricted-activity days per quarter was experienced in the October-December 1957 quarter with 4.5 days per person and the lowest number occurred in July-September 1959 with 1.4 days per person.

This report presents an analysis of the incidence of and associated disability from acute conditions for 16 quarters of data collection to show seasonal variations. A companion report, Acute Conditions, Geographic Distribution, B-34, presents annual estimates of incidence of acute conditions for each of the four years of data collection to show trends in the geographic distribution of acute conditions and to present detailed information for the year, July 1960-June 1961. Similar data, reported from the National Health Survey, Series B, No. 24, presented an analysis of seasonal variations for the 12 quarters of reporting of acute conditions from July 1957-June

1960. Other reports from the National Health Survey containing information about acute conditions are Series B, Nos. 5, 6, 18, and 23, and Series C Nos. 1 and 4.

SOURCE OF DATA

The information contained in this publication is derived from household interviews conducted by the National Health Survey in co-operation with the Bureau of the Census of a probability sample of the civilian, noninstitutional population of the United States. The sample is designed so that interviews are conducted during every week of the year. During the 16-quarter period from July 1957-June 1961 the sample was composed of approximately 149,000 households containing about 485,000 persons living at the time of the interview.

A description of the design of the survey, the methods used in estimation, and general qualifications of the data obtained from surveys is presented in Appendix I. Since the estimates shown in this report are based on a sample of the population rather than on the entire population, they are subject to sampling error. Therefore, particular attention should be paid to the section entitled "Reliability of Estimates." Since the estimates based on a three-month-interviewing period are subject to higher sampling errors than estimates based on a 12-month period, the quarterly estimates should be interpreted with caution, especially for those estimates of relatively low magnitude.

Certain terms used in this report are defined in Appendix II. Some of the terms have specialized meanings for the purpose of the survey. For example, an acute condition is defined, with certain exceptions, as a condition which has lasted less than three months and which has involved either medical attention or restricted activity. The exceptions, which are listed in Appendix II, are certain conditions such as heart trouble and diabetes which are always considered to be chronic.

The questionnaire used by the Health Interview Survey during July 1960-June 1961 is reproduced in Appendix III. The questions (11-17 and Table I) designed to elicit information about acute conditions are substantially the same as those used in the earlier versions of the questionnaire.

Each condition reported in response to the illness-recall questions (11-17) was entered on a line of Table I. Further questions were asked to obtain a better description of the specific condition and to obtain information about the actions taken by the person, such as seeking medical attention or restricting his usual activities.

INCIDENCE OF ACUTE CONDITIONS AND ASSOCIATED DAYS OF DISABILITY BY QUARTER

During the 16 quarters in the period from July 1957-June 1961 there was a marked seasonal variation in the incidence rates of acute conditions per 100 persons (tables 1 and 2). As shown in figure 1, the seasonal pattern had peaks in the January-March quarter of three of the four years; seasonal lows were reached in the July-September quarter of each year. In the first year of reporting the seasonal high was in the October-December 1957 quarter as a result of the epidemic of Asian influenza. Figure 2 shows that other respiratory conditions, including influenza, reached the high point in October-December 1957, while upper respiratory conditions reached a peak during the January-March 1958 quarter in conforming with the usual pattern. During July 1960-June 1961 the incidence of acute conditions showed the least amount of seasonal variation of any of the four years.

The influence of the incidence of acute respiratory conditions on the rates for all acute conditions is shown in figure 1. Since about three of each five acute conditions are respiratory conditions, it is not surprising that the pattern of the seasonal distribution of all acute conditions is quite similar to the pattern for acute respiratory conditions (fig. 1).¹

There is less seasonal variation in the incidence of injuries and of infective and parasitic diseases than for all acute conditions as evidenced by repetition of cyclical movement. However, the rise and fall of these curves is well within sampling variability and may be due to

chance alone. The high and low points for the incidence of infective and parasitic diseases correspond to the pattern for all acute conditions in the last three of the four years of data. The low rates for infective and parasitic conditions during July-December 1957 may have been due to the influence of the Asian influenza epidemic on the diagnostic information obtained in interviews. Illnesses which would have ordinarily been reported as "virus infection," "the virus," or other ill-defined conditions classifiable to infective and parasitic diseases may have been reported during the epidemic period as Asian influenza. The classification of such conditions as respiratory would result in the unusually low rate for infective and parasitic conditions.

The curve for injuries exhibits a seasonal pattern that is the reverse of that for all conditions—high when the curve for all conditions is low, and vice versa. A small seasonal pattern of variation is shown for digestive system conditions; however, it is quite irregular since it disappears during the four quarters of 1958 and part of 1959.

Tables 3 and 4 show the age distribution of the incidence of acute conditions during each of the 16 quarters. The effect of age on seasonal variation as shown in figure 3 is such that for the youngest age group there is less relative rise and fall in the age-specific incidence rates than is present for the older age groups. The age group, 5-14, has the largest relative difference between high and low points in each cycle. Age-specific incidence rates for the acute respiratory and injury condition groups are shown in tables 17 and 20, respectively.

The distribution of days of restricted activity and bed disability per 100 persons exhibits about the same type of seasonal pattern as for the incidence rates (tables 5-12). In 14 of the 16 quarters respiratory conditions contributed the largest proportion of days to the total number of restricted-activity days. The exceptions were July-September of 1958 and 1960 during which injuries had the largest number of restricted-activity days (table 5). The proportionate contribution to the total by the other condition groups varied from quarter to quarter.

In terms of the number of restricted-activity days per condition, a rate which may be considered as a measure of severity among the persons exposed to the risk of incurring such disability, the most interesting curve in figures 4 and 5 is that for injuries. The curve for a particular condition group was obtained by dividing the number of restricted-activity days for the group by the number of cases in the condition group. In figure 1 the incidence curve for injuries

¹The rates shown in all of the figures depicting seasonal trends are plotted on semilogarithmic scale so that visual comparisons can be made of relative amounts of seasonal variation within and between individual curves of condition groups or age groups.

Figure 1. Incidence of acute conditions per 100 persons per quarter.

had seasonal high points in the July-September quarter while the curve for restricted-activity days per condition had high points in the January-March quarter. Tables 20-22 have been included to explain this seeming discrepancy. Comparing these two quarters in each of the four years (table 20) shows that in July-September an average of 37.4 percent of the injuries were sustained by young people under 15 and 22.9 percent by persons 45 years of age and over. During January-

March an average of 33.4 percent of the injuries were sustained by young people under 15 and 25.2 percent by older persons 45 years and over. Since older persons have a longer recuperation time per injury (fig. 6), this explains the apparent discrepancy in seasonal peaks.

The gradual rise in the duration of restricted activity per injury during the 16 quarters, as shown in figures 5 and 6, should not, at present be taken to indicate that the severity of injuries

is changing. The period under study is too short to judge the significance of this rise until further data have been accumulated.

An indication of the effect of acute conditions on work-loss days is given in figure 7 and tables 13 and 14. Figure 7 shows the average number of persons absent from work each day because of acute conditions. More males than females were absent from work each day, but since the working population is heavily weighted with males, such an effect is expected. Respiratory conditions and

injuries were the leading causes of work loss, but injuries exerted a relatively greater influence as a cause of work loss than they did as a cause of restricted activity among all persons. The proportion of work-loss days resulting from injuries is 26 percent of the total number, while only 17 percent of all restricted-activity days may be attributed to injuries.

Seasonal variations in the average number of persons with work loss indicate no sharp rise during the winters of 1958-59 and 1960-61. The

Figure 7. Persons absent from work each day because of acute conditions by sex.

epidemics of Asian influenza during the winters of 1957-58 and 1959-60 account for the high rate of work loss during these years.

School-loss days associated with acute conditions per 100 children aged 6-16 years of age are shown in tables 15 and 16. The seasonal peaks coincide with those shown in figure 1 for the incidence of acute conditions. Respiratory

conditions were the primary cause of days lost from school resulting from acute conditions.

Since acute respiratory conditions and injuries represent such a large proportion of the total number of acute conditions, separate tables showing incidence, restricted-activity days, and bed-disability days by age are shown in tables 17-22.

in Current Population Reports: Series P-20, P-25 and P-60.

APPENDIX I

TECHNICAL NOTES ON METHODS

Background of This Report

This report, Acute Conditions: Seasonal Variations, is one of a series of statistical reports prepared by the U. S. National Health Survey. It is based on information collected in a continuing nationwide sample of households in the Health Interview Survey, which is one of the major parts of the program.

The Health Interview Survey utilizes a questionnaire which, in addition to personal and demographic characteristics, obtains information on illnesses, injuries, chronic conditions and impairments, health insurance coverage, and other health topics. As data relating to each of these various broad topics are tabulated and analyzed, separate reports are issued which cover one or more of the specific topics. The present report is based on the consolidated sample for 208 weeks of interviewing ending June 1961.

The population covered by the sample for the Health Interview Survey is the civilian, noninstitutional population of the United States living at the time of the interview. The sample does not include members of the Armed Forces, U. S. nationals living in foreign countries, or crews of vessels. It should also be noted that the estimates shown do not represent a complete inventory of acute conditions for the specified calendar period since no adjustment has been made for persons who incurred acute conditions during the two-week-recall period but who died prior to the interview.

Statistical Design of the Health Interview Survey

General plan.—The sampling plan of the survey follows a multistage probability design which permits a continuous sampling of the civilian population of the United States. The first stage of this design consists of drawing a sample of 500 from the 1,900 geographically defined Primary Sampling Units (PSU's) into which the United States has been divided. A PSU is a county, a group of contiguous counties, or a Standard Metropolitan Statistical Area.

With no loss in general understanding, the remaining stages can be telescoped and treated in this discussion as an ultimate stage. Within PSU's, then, ultimate stage units called segments are defined, also geographically, in such a manner that each segment contains an expected six households in the sample. Each week a random sample of about 120 segments is drawn. In the approximately 700 households in those segments, household members are interviewed concerning factors related to health.

Since the household members interviewed each week are a representative sample of the population, samples for successive weeks can be combined into

larger samples. Thus the design permits both continuous measurement of characteristics of high incidence or prevalence in the population, and through the larger consolidated samples, more detailed analysis of less common characteristics and smaller categories. The continuous collection has administrative and operational advantages as well as technical assets, since it permits field work to be handled with an experienced, stable staff.

Sample size and geographic detail.—The sample plan for each 13-week quarter from July 1957-June 1961 included about 30,000 persons from 9,000 households. Over the 12-month period ending June 1961, the sample included approximately 125,000 persons from 38,000 households in 6,400 segments. The over-all sample was designed in such a fashion that tabulations can be provided for each of the major geographic regions and for urban and rural sectors of the United States.

Collection of data.—The field operations for the household survey are performed by the Bureau of the Census under specifications established by the Public Health Service. In accordance with these specifications the Bureau of the Census designs and selects the sample; conducts the field interviewing, acting as the collecting agent for the Public Health Service; and edits and codes the questionnaires. Tabulations are prepared by the Public Health Service using the Bureau of the Census electronic computers.

Estimating methods.—Each statistic produced by the survey—for example, the number of work-loss days occurring in a specified period—is the result of two stages of ratio estimation. In the first of these, the factor is the ratio of the 1950 decennial population count to the 1950 estimated population in the U. S. National Health Survey's first-stage sample of PSU's. These factors are applied for some 50 color-residence classes.

Later, ratios of sample-produced estimates of the population to official Bureau of the Census figures for current population in about 60 age-sex-color classes are computed, and serve as second-stage factors for ratio estimating.

The effect of the ratio estimating process is to make the sample more closely representative of the population by age, sex, color, and residence, thus reducing sampling variance.

As noted, each week's sample represents the population living during that week and characteristics of that population. Consolidation of samples over a time period, say a calendar quarter, produces estimates of average characteristics of the U. S. population for that calendar quarter. Similarly, population data for a year are averages of the four quarterly figures.

For statistics measuring the number of occurrences during a specified time period, such as the

number of bed-disability days, or incidence of acute conditions, a similar computational procedure is used, but the statistics have a different interpretation. For these items, the questionnaire asks for the respondent's experience over the two calendar weeks prior to the week of interview. In such instances the estimated quarterly total for the statistic is simply 6.5 times the average two-week estimate produced by the 13 successive samples taken during the period. The annual total is the sum of the four quarters. Thus, the experience of persons interviewed during a year—experience which actually occurred for each person in a two-calendar-week interval prior to week of interview—is treated as though it measured the total of such experience during the year. Such interpretation leads to no significant bias.

General Qualifications

Nonresponse.—Data were adjusted for nonresponse by a procedure which imputes to persons in a household which was not interviewed the characteristics of persons in households in the same segment which were interviewed. The total noninterview rate was 5 percent; 1 percent was refusal, and the remainder was primarily due to the failure to find any eligible household respondent after repeated trials.

The interview process.—The statistics presented in this report are based on replies secured in interviews of persons in the sampled households. Each person 18 years of age and over, available at the time of interview, was interviewed individually. Proxy respondents within the household were employed for children and for adults not available at the time of the interview, provided the respondent was closely related to the person about whom information was being obtained.

There are limitations to the accuracy of diagnostic and other information collected in household interviews. For diagnostic information, the household respondent can, at best, pass on to the interviewer only the information the physician has given to the family. For conditions not medically attended, diagnostic information is often no more than a description of symptoms. However, other facts, such as the number of disability days caused by the condition, can be obtained more accurately from household members than from any other source since only the persons concerned are in a position to report information of this type.

Rounding of numbers.—The original tabulations on which the data in this report are based show all estimates to the nearest whole unit. All consolidations were made from the original tabulations using the estimates to the nearest unit. In the final published tables the figures are rounded to the nearest thousand, although they are not necessarily accurate to that detail. Devised statistics, such as rates and percent distributions, are computed after the estimates on which they are based have been rounded to the nearest thousand.

Population figures.—Some of the published tables include population figures for specified categories. Except for certain over-all totals by age and sex, which are adjusted to independent estimates, these figures are based on the sample of households in the U. S. National Health Survey. They are given primarily for the purpose of providing denominators for rate computation,

and for this purpose are more appropriate for use with the accompanying measures of health characteristics than other population data that may be available. In some instances they will permit users to recombine published data into classes more suitable to their specific needs. With the exception of the over-all totals by age and sex, mentioned above, the population figures differ from corresponding figures (which are derived from different sources) published in reports of the Bureau of the Census. For population data for general use, see the official estimates presented in Bureau of the Census reports in the P-20, P-25, and P-60 series.

Reliability of Estimates

Since the estimates are based on a sample, they will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and interviewing personnel and procedures. As in any survey, the results are also subject to measurement error.

The standard error is primarily a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. As calculated for this report, the standard error also reflects part of the variation which arises in the measurement process. It does not include estimates of any biases which might lie in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error and about 99 out of 100 that it would be less than $2\frac{1}{2}$ times as large.

The relative standard error of an estimate is obtained by dividing the standard error of the estimate by the estimate itself, and is expressed as a percentage of the estimate. Included in this Appendix are charts from which the relative standard errors can be determined for estimates shown in the report. In order to derive relative errors which would be applicable to a wide variety of health statistics and which could be prepared at a moderate cost, a number of approximations were required. As a result, the charts provide an estimate of the approximate relative standard error rather than the precise error for any specific aggregate or percentage.

Three classes of statistics for the health survey are identified for purposes of estimating variances.

Narrow range.—This class consists of (1) statistics which estimate a population attribute, e.g., the number of persons in a particular income group, and (2) statistics for which the measure for a single individual for the period of reference is usually either 0 or 1, on occasion may take on the value 2, and very rarely, 3.

Medium range.—This class consists of other statistics for which the measure for a single individual for the period of reference will rarely lie outside the range 0 to 5.

Wide range.—This class consists of statistics for which the measure for a single individual for the period of reference frequently will range from 0 to a number in excess of 5, e.g., the number of days of work loss experienced during the year.

In addition to classifying variables according to whether they are narrow-, medium-, or wide-range, statistics in the survey are further defined as:

Type A.—Statistics on prevalence, and incidence data for which the period of reference in the questionnaire is 12 months.

Type B.—Incidence-type statistics for which the period of reference in the questionnaire is two weeks.

Only the charts on sampling error applicable to data contained in this report are presented. Those shown are charts for aggregates based on one calendar quarter of data collection.

General rules for determining relative sampling errors.—The "guide" on page 49, together with the following rules, will enable the reader to determine approximate relative standard errors from the charts for estimates presented in this report.

Rule 1. Estimates of aggregates: Approximate relative standard errors of estimates of aggregates, such as the number of persons with a given characteristic, or the number of disability days are obtained from appropriate curves on pages 50 and 51. The number of persons in the total U.S. population or in an age-sex class of the total population is adjusted to official Bureau of the Census figures and is not subject to sampling error.

Rule 2. Estimates of rates where the numerator is not a subclass of the denominator: This rule applies where a unit of the numerator often occurs more than once for any one unit in the denominator. For example, in the computation of the number of days of work loss per person per year, several of the days included in the numerator could be assigned to a person (one unit) in the denominator. Approximate relative standard errors for rates of this kind may be computed as follows:

- (a) Where the denominator is the total U. S. population, or includes all persons in one or more of the age-sex groups of the total population, the relative error of the rate is equivalent to the relative error of the numerator which can be obtained directly from the appropriate chart.
- (b) In other cases, obtain the relative standard error of the numerator and of the denominator from the appropriate curve. Square each of these relative errors, add the resulting values, and extract the square root of the sum. This procedure will result in an upper bound, and often will overstate the error.

Guide to Use of Relative Standard Error Charts

The code shown below identifies the appropriate curve to be used in estimating the relative standard error of the statistic described. The four components of each code describe the statistic as follows: (1)

A = aggregate, P = percentage; (2) the number of calendar quarters of data collection; (3) the type of the statistic as described on page 48; and (4) the range of the statistic as described on page 47.

Statistic	Use:		
	Rule	Code	on page
Number of: Acute conditions per quarter-----	1	A1BN	50
Disability days per quarter-----	1	A1BW	51
Persons in the U. S. population, or total number of persons in any age-sex category--	Not subject to sampling error		
Incidence rates for acute conditions: Per 100 total U. S. population or per 100 persons in any age-sex group of the total U. S. population-----	2(a)	A1BN	50
Number of disability days: Per case for acute conditions -----	2(b)	{ Numer.: A1BW Denom.: A1BN	51 50
Average number of persons absent from work each day because of an acute condition-----	1	A1BW (with value for number of work days lost because of the con- dition read from the curve)	51

Relative standard errors for aggregates based on one quarter of data for type B data,
narrow range

Example of use of chart: An aggregate of 6,000,000 (on scale at bottom of chart) for a Narrow range Type B statistic has a relative standard error of 19.3 percent, read from scale at left side of chart, or a standard error of 1,158,000 (19.3 percent of 6,000,000).

Relative standard errors for aggregates based on one quarter of data collection for type B data, wide range

Example of use of chart: An aggregate of 20,000,000 (on scale at bottom of chart) for a wide range type B statistic has a relative standard error of 16.0 percent, read from scale at left side of chart, or a standard error of 3,200,000 (16.0 percent of 20,000,000).

APPENDIX II

DEFINITIONS OF CERTAIN TERMS USED IN THIS REPORT

Terms Relating to Conditions

Condition.—A morbidity condition, or simply a condition, is any entry on the questionnaire which describes a departure from a state of physical or mental well-being. It results from a positive response to one of a series of "illness-recall" questions. In the coding and tabulating process, conditions are selected or classified according to a number of different criteria, such as, whether they were medically attended; whether they resulted in disability; whether they were acute or chronic; or according to the type of disease, injury, impairment, or symptoms reported. For the purposes of each published report or set of tables, only those conditions recorded on the questionnaire which satisfy certain stated criteria are included.

Acute conditions are classified by type according to the International Classification of Diseases, 1955 Revision, with certain modifications adopted to make the code more suitable for a household-interview-type survey.

Acute condition.—An acute condition is defined as a condition which has lasted less than three months and which has involved either medical attention or restricted activity. Because of the procedures used to estimate incidence, the acute conditions included in this report are the conditions which had their onset during the two weeks prior to the interview week and which involved either medical attention or restricted activity during that two-week period. However, it excludes certain conditions which are always classified as chronic (listed below) even though the onset occurred within three months.

Conditions always classified as chronic:

Asthma	Arthritis or rheumatism
Hay fever	Mental illness
Tuberculosis	Diabetes
Chronic bronchitis	Thyroid trouble or goiter
Repeated attacks of sinus trouble	Any allergy
Rheumatic fever	Epilepsy
Hardening of the arteries	Chronic nervous trouble
High blood pressure	Cancer
Heart trouble	Chronic skin trouble
Stroke	Hernia or rupture
Trouble with varicose veins	Prostate trouble
Hemorrhoids or piles	Deafness or serious trouble with hearing
Tumor, cyst, or growth	Serious trouble with seeing, even when wearing glasses
Chronic gallbladder or liver trouble	Cleft palate
Stomach ulcer	Any speech defect
Any other chronic stomach trouble	Missing fingers, hand, or arm—toes, foot, or leg
Kidney stones or chronic kidney trouble	Palsy

Paralysis of any kind	deformity of the foot,
Repeated trouble with back or spine	leg, fingers, arm, or back
Club foot	Condition present since birth
Permanent stiffness or	

Condition groups.—Conditions are classified according to the International Classification of Diseases, 1955 Revision, with certain modifications adopted to make the code more suitable for a household interview survey. In this report, all tables which have data classified by type of condition employ a 5 category regrouping plus several selected subgroups. The International Classification code numbers included in each category are shown below.

<u>Condition Groups</u>	<u>International Classification Code Numbers</u>
I Infective and parasitic diseases	020-138
II Respiratory conditions	470-501, 511, 514 517-525, 527, 783
Upper respiratory	470-475, 511, 514, 517
Other respiratory	480-501, 518-525, 527 783
III Digestive system conditions	530-539, 543-553, 570 571, 573-587, 784, 785
IV Injuries	N800-N885, N890-N895 N900-N994, N996-N999
V Other conditions	All other acute code numbers

Onset of condition.—A condition is considered to have had its onset when it was first noticed. This could be the time the person first felt sick or became injured, or it could be the time when the person or his family was first told by a physician that he had a condition of which he was previously unaware.

Incidence of conditions.—The incidence of conditions is the estimated number of conditions having their onset in a specified time period. As previously mentioned, minor acute conditions, involving neither restricted activity nor medical attention are excluded from the statistics. The incidence data shown in some reports are further limited to various subclasses of conditions, such as, "incidence of conditions involving bed disability."

Activity-restricting condition.—An activity restricting condition is a condition which has caused at least one day of restricted activity during the two calendar weeks before the interview week. (See def-

inition of "Restricted-activity day.") The incidence of acute activity-restricting conditions is estimated from the number of such conditions reported as having started in the two-week period, but a condition which did not result in restricted activity until after the end of the two-week period in which it had its onset is not included.

Bed-disabling condition.—A condition involving at least one day of bed disability is called a bed-disabling condition. (See definition of "Bed-disability day.") The incidence of acute bed-disabling conditions is defined in a manner analogous to the incidence of acute activity-restricting conditions.

Medically attended condition.—A condition is considered to be medically attended if a physician has been consulted about it either at its onset or at any time thereafter. Medical attention includes consultation either in person or by telephone for treatment or advice. Advice from the physician transmitted to the patient through the nurse is counted as well as visits to physicians in clinics or hospitals. If during the course of a single visit the physician is consulted about more than one condition for each of several patients, each condition of each patient is counted as medically attended.

Discussions of a child's condition by the physician and a responsible member of the household are considered as medical attention even if the child was not seen at that time.

For the purpose of this definition, the term "physician" includes doctors of medicine and osteopathic physicians.

Terms Relating to Disability

Disability.—Disability is the general term used to describe any temporary or long-term reduction of a person's activity as a result of an acute or chronic condition.

Disability days are classified according to whether they are days of restricted activity, bed-days, work-loss days, or school-loss days. All days of bed disability are, by definition, days of restricted activity. The converse form of this statement is, of course, not true. Days lost from work and days lost from school are also days of restricted activity for the working and school-age populations. Hence, restricted activity is the most inclusive term used in describing disability days.

Condition-days of restricted activity, bed disability, etc.—Condition-days of restricted activity, bed disability, and so forth are days of the various forms of disability associated with any one condition. Since any particular day of disability may be associated with more than one condition, the sum of days for all con-

ditions adds to more than the total number of person-days of disability.

Restricted-activity day.—A day of restricted activity is one on which a person substantially reduces the amount of activity normal for that day because of a specific illness or injury. The type of reduction varies with the age and occupation of the individual as well as with the day of the week or season of the year. Restricted activity covers the range from substantial reduction to complete inactivity for the entire day.

Bed-disability day.—A day of bed disability is one on which a person stays in bed for all or most of the day because of a specific illness or injury. It is considered to be a day only if the period of bed disability includes more than half of the daylight hours. All hospital days for inpatients are considered to be days of bed disability even if the patient was not actually in bed at the hospital.

Work-loss day.—A day lost from work is a normal working day on which a person did not work at his job or business because of a specific illness or injury. If the person's regular work day is less than a whole day and the entire work day was lost, it would be counted as a whole work day lost. The number of days lost from work is determined only for persons 17 years of age or over who reported that at any time during the two-week period covered by the interview they either worked at, or had a job or business.

School-loss day.—A day lost from school is a normal school day on which a child did not attend school because of a specific illness or injury. The number of days lost from school is determined only for children 6-16 years of age.

Demographic Terms

Age.—The age recorded for each person is the age at last birthday. Age is recorded in single years and grouped in a variety of distributions depending upon the purpose of the table.

Quarter.—The quarters used by the U. S. National Health Survey are actually 13-week periods rather than 3 calendar months. Since each 13-week period begins on a Monday and ends on a Sunday, the actual dates of the beginning and end of each 13-week period may overlap into another calendar quarter. Therefore, the time periods in the table headings are the approximate rather than the precise periods during which the interviewing was conducted.

In order to compute the number of persons absent from work each day, the assumption was made that there are 245 work days in the year or 61.25 work days in each quarter.

APPENDIX III

QUESTIONNAIRE

The items below show the exact content and wording of the basic questionnaire used in the nationwide household survey of the U. S. National Health Survey. The actual questionnaire is designed for a household as a unit and includes additional spaces for reports on more than one person, condition, accident or hospitalization. Such repetitive spaces are omitted in this illustration.

CONFIDENTIAL - The National Health Survey is authorized by Public Law 652 of the 84th Congress (70 Stat 489; 42 U.S.C. 305). All information which would permit identification of the individual will be held strictly confidential, will be used only by persons engaged in and for the purposes of the survey, and will not be disclosed or released to others for any other purposes (22 FR 1687).

Reason: <input type="checkbox"/> Refusal (Fill Item 19) <input type="checkbox"/> No one at home - repeated calls <input type="checkbox"/> Temporarily absent <input type="checkbox"/> Other (Specify)	} Fill Item 20	<input type="checkbox"/> Vacant - non-seasonal <input type="checkbox"/> Vacant - seasonal <input type="checkbox"/> Usual residence elsewhere <input type="checkbox"/> Armed Forces <input type="checkbox"/> Other (Specify)	<input type="checkbox"/> Demolished <input type="checkbox"/> In sample by mistake <input type="checkbox"/> Eliminated in sub-sample <input type="checkbox"/> Other (Specify)	
		Interview not obtained for: Cos. because: _____		
		19. Reason for refusal		
		20. TYPE A FOLLOW-UP PROCEDURE		

If final call results in a Type A non-interview (except Refusals) take the following steps:

- Contact neighbors (caretakers, etc.) until you find someone who knows the family.
- Find out the number of people in the household, their names and approximate ages; if names of all members not known, ascertain relationships. Record this information in the regular spaces inside the questionnaire.
- Find out if anyone in the housing unit is now in a hospital as a patient; if so, which person it is. This is done by asking the following question:

4. Is anyone in the household now in the hospital? Yes No Don't know No contact made

(a) If "Yes," - Who? (Enter name) _____ (Col. No.) _____

1. (a) What is the name of the head of this household? (Enter name in first column) (b) What are the names of all other persons who live here? (List all persons who usually live here, and all persons staying here who have no usual place of residence elsewhere. List these persons in the prescribed order.) (c) Do any (other) lodgers or roomers live here? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) _____ (d) Is there anyone else who lives here who is now temporarily in a hospital? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) _____ (e) Away on business? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) _____ (f) On a visit? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) _____ (g) Is there anyone else staying here now? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) _____ (h) Do any of the people in this household have a home elsewhere? <input type="checkbox"/> No (leave on questionnaire) <input type="checkbox"/> Yes (apply household membership rules; if not a member, delete)	Last name (1) _____ First name and initial _____	Last name (2) _____ First name and initial _____
2. How are you related to the head of the household? (Enter relationship to head, for example: head, wife, daughter, grandson, mother-in-law, partner, lodger, lodger's wife, etc.)	Relationship Head	Relationship

3. How old were you on your last birthday?	Age _____ <input type="checkbox"/> Under 1 year
4. Race (Check one box for each person)	<input type="checkbox"/> White <input type="checkbox"/> Negro <input type="checkbox"/> Other
5. Sex (Check one box for each person)	<input type="checkbox"/> Male <input type="checkbox"/> Female
6. Are you now married, widowed, divorced, separated or never married? (Check one box for each person)	<input type="checkbox"/> Married <input type="checkbox"/> Divorced <input type="checkbox"/> Widowed <input type="checkbox"/> Separated <input type="checkbox"/> Never married
7. (a) What is the highest grade you attended in school? (Circle highest grade attended or check "None") (b) Did you finish the - - grade (year)?	<input type="checkbox"/> Under 17 years Elem: 1 2 3 4 5 6 7 8 High: 1 2 3 4 College: 1 2 3 4 5+ <input type="checkbox"/> None ----- <input type="checkbox"/> Yes <input type="checkbox"/> No
8. (a) Did you ever serve in the Armed Forces of the United States? If "Yes," ask: (b) Are you now in the Armed Forces, not counting the reserves? (If "Yes," delete this person from questionnaire) → (c) Was any of your service during a war or was it peace-time only? If "War," ask: (d) During which war did you serve? If "Peace-time" only, ask: (e) Was any of your service between June 27, 1950 and January 31, 1955?	<input type="checkbox"/> Yes <input type="checkbox"/> No ----- <input type="checkbox"/> Yes <input type="checkbox"/> No ----- <input type="checkbox"/> War <input type="checkbox"/> Peace-time only ----- <input type="checkbox"/> WW II <input type="checkbox"/> Korean <input type="checkbox"/> Other ----- <input type="checkbox"/> Yes <input type="checkbox"/> No
9. (a) What were you doing most of the past 12 months - - (For males): working, or doing something else? (For females): working, keeping house, or doing something else? If "Something else" checked, and person is 45 years old or over, ask: (b) Are you retired?	<input type="checkbox"/> Under 17 years <input type="checkbox"/> Working <input type="checkbox"/> Keeping house <input type="checkbox"/> Something else ----- <input type="checkbox"/> Yes <input type="checkbox"/> No
10. (a) Were you working last week or the week before? If "Keeping house" or "Something else" in q. 9(a), ask: (b) Did you work at a job or business at any time last week or the week before? If "No," in q. 10(a) or 10(b), ask: (c) Even though you did not work last week or the week before, do you have a job or business?	<input type="checkbox"/> Under 17 years <input type="checkbox"/> Yes <input type="checkbox"/> No ----- <input type="checkbox"/> Yes <input type="checkbox"/> No
NOTE: Determine which adults are at home and record this information. Beginning with question 11 you are to interview for himself or herself, each adult person who is at home.	<input type="checkbox"/> Under 17 years <input type="checkbox"/> At home <input type="checkbox"/> Not at home
11. Were you sick at any time LAST WEEK OR THE WEEK BEFORE? (That is, the 2-week period which ended last Sunday)? (a) What was the matter? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
12. Last week or the week before did you take any medicine or treatment for any condition (besides... which you told me about)? (a) For what conditions? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
13. Last week or the week before did you have any accidents or injuries? (a) What were they? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
14. Did you ever have on (any other) accident or injury that was still bothering you last week or the week before? (a) In what way did it bother you? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
15. AT THE PRESENT TIME do you have any ailments or conditions that have lasted for a long time? (If "No") Even though they don't bother you all the time? (a) What are they? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
16. Has anyone in the family - you, your -, etc. - had any of these conditions DURING THE PAST 12 MONTHS? (Read Card A, condition by condition; record any conditions mentioned in the column for the person)	<input type="checkbox"/> Yes <input type="checkbox"/> No
17. Does anyone in the family have any of these conditions? (Read Card B, condition by condition; record any conditions mentioned in the column for the person)	<input type="checkbox"/> Yes <input type="checkbox"/> No
R For persons 17 years old or over, show who responded for (or was present during the asking of) questions 11-17. If person responded for self, show whether entirely or partly. For persons under 17, show who responded for them.	<input type="checkbox"/> Responded for self-entirely <input type="checkbox"/> Responded for self-partly Col. No. _____ was respondent
18. (a) Has anyone in the family been in a hospital DURING THE PAST 12 MONTHS? If "Yes," (b) How many different times were you in the hospital overnight or longer?	<input type="checkbox"/> Yes <input type="checkbox"/> No ----- _____ No. of times
19. (a) During the past 12 months has anyone in the family been a patient in a nursing home or sanitarium? If "Yes," (b) How many times were you in a nursing home or sanitarium?	<input type="checkbox"/> Yes <input type="checkbox"/> No ----- _____ No. of times
20. If baby under one year listed as a household member, ask: (a) Was - - - baby born in a hospital or at home? If "hospital" in q. 20(a) and 1 or more in q. 18(b), ask: (b) Was this hospitalization included in the number you just gave me?	<input type="checkbox"/> Hospital <input type="checkbox"/> Home ----- <input type="checkbox"/> Yes <input type="checkbox"/> No

Table I - ILLNESSES, IMPAIRMENTS AND INJURIES												
Line number	Col. No. of person	Question number	Did you EVER or any time talk to a doctor about ... ?	Ask for all illnesses and present effects of old injuries: (a) If doctor talked to: What did the doctor say it was? -- did he give it a medical name? (b) If doctor not talked to: Record original entry and ask (d-2)-(d-5) as required. Ask for all injuries during past 2 weeks: What part of the body was hurt? What kind of injury was it? Anything else? (Also, fill Table A for all injuries)	What was the cause of...? (This column is to be asked if entry in Col. (d-1) is an Impairment or a Symptom or If entry in Col.(d-1) is from q. 14 or q.17) (If "Cause" is an injury, also fill Table A)	If eye trouble of any kind and 6 years old or over, ask: Can you see well enough to read ordinary newspaper print with glasses?	What kind of... is it? Ask only for: Any entry in Col. (d-1) or (d-2) that includes the words: Asthma "condition" Cysts "disease" Growths Tumor "trouble" For an allergy or stroke ask: How does the... affect you?	What part of the body is affected? Ask only for: Impairments; Injuries; and for: Abscesses, boils, infections, inflammation, sores, ulcers Aches, pains, soreness, weakness Bleeding or blood clots Cancer, tumor, cysts or growths Neuralgia or neuritis Virus Show detail for: Ear or eye - (one or both) Head - (Skull, scalp, face) Back - (Upper, middle, lower) Arm - (Shoulder, upper, elbow, lower, wrist, hand; one or both) Leg - (Hip, upper, knee, lower, ankle, foot; one or both)	LAST WEEK OR THE WEEK BEFORE did... course you cut down on your usual activities for as much as a day?	How many days, including the Saturdays and Sundays?	How many of these... days were you in bed all or most of the day?	If 6-16 years old ask: How many days did... keep you from school last week or the week before?

- No. 3. Concepts and Definitions in the Health Household-Interview Survey. 30 cents.
- No. 4. Plan and Initial Program of the Health Examination Survey.

Series B (Health Interview Survey results by topics)

- No. 8. Persons Injured by Class of Accident, United States, July 1957-June 1958. 40 cents.
- No. 9. Impairments by Type, Age, and Sex, United States, July 1957-June 1958. 25 cents.
- No. 10. Disability Days, United States, July 1957-June 1958. 40 cents.
- No. 11. Limitation of Activity and Mobility Due to Chronic Conditions, United States, July 1957-June 1958. 30 cents.
- No. 12. Chronic Respiratory Conditions Reported in Interviews, United States, July 1957-June 1958. 30 cents.
- No. 13. Heart Conditions and High Blood Pressure Reported in Interviews, United States, July 1957-June 1958. 30 cents.
- No. 14. Dental Care, Interval and Frequency of Visits, United States, July 1957-June 1959. 35 cents.
- No. 15. Dental Care, Volume of Visits, United States, July 1957-June 1959. 35 cents.
- No. 16. Types of Injuries, Incidence and Associated Disability, United States, July 1958-June 1959. 30 cents.
- No. 17. Peptic Ulcers Reported in Interviews, United States, July 1957-June 1959. 25 cents.
- No. 18. Acute Conditions, Incidence and Associated Disability, United States, July 1958-June 1959. 30 cents.
- No. 19. Volume of Physician Visits, United States, July 1957-June 1959. 40 cents.
- No. 20. Arthritis and Rheumatism Reported in Interviews, United States, July 1957-June 1959. 25 cents.
- No. 21. Diabetes Reported in Interviews, United States, July 1957-June 1959. 25 cents.
- No. 22. Loss of Teeth, United States, July 1957-June 1958. 25 cents.
- No. 23. Acute Conditions, Geographic Distribution, United States, July 1958-June 1959. 30 cents.
- No. 24. Acute Conditions, Seasonal Variations, United States, July 1957-June 1960. 35 cents.
- No. 25. Hernias Reported in Interviews, United States, July 1957-June 1959. 25 cents.
- No. 26. Interim Report on Health Insurance, United States, July-December 1959. 45 cents.
- No. 27. Distribution and Use of Hearing Aids, Wheel Chairs, Braces, and Artificial Limbs, United States, July 1958-June 1959. 25 cents.
- No. 28. Persons Receiving Care at Home, United States, July 1958-June 1959. 30 cents.
- No. 29. Disability Days, United States, July 1959-June 1960. 40 cents.
- No. 30. Proportion of Hospital Bill Paid By Insurance, Discharged From Short-Stay Hospitals, United States, July 1958-June 1960. 40 cents.
- No. 31. Duration of Limitation of Activity Due to Chronic Conditions, United States, July 1959-June 1960. 30 cents.
- No. 32. Hospital Discharges and Length of Stay: Short-Stay Hospitals, United States, 1958-1960.
- No. 33. Acute Conditions, Seasonal Variations, United States, July 1957-June 1961.
- No. 34. Acute Conditions, Geographic Distribution, United States, July 1960-June 1961.

Series C (Health Interview Survey results for population groups)

- No. 1. Children and Youth, Selected Health Characteristics, United States, July 1957-June 1958. 35 cents.
- No. 2. Veterans, Health and Medical Care, United States, July 1957-June 1958. 40 cents.
- No. 3. The Hawaii Health Survey, Description and Selected Results, Oahu, Hawaii, October 1958-September 1959. 40 cents.
- No. 4. Older Persons, Selected Health Characteristics, United States, July 1957-June 1959. 45 cents.
- No. 5. Selected Health Characteristics by Area, Regions and Urban-Rural Residence, United States, July 1957-June 1959. 35 cents.
- No. 6. Selected Health Characteristics by Area, Divisions and Large Metropolitan Areas, United States, July 1957-June 1959. 35 cents.
- No. 7. Currently Employed Persons, Illness and Work-Loss Days, United States, July 1959-June 1960.

Series D (Developmental and Evaluation Reports)

- No. 1. A Study of Special Purpose Medical-History Techniques. 30 cents.
- No. 2. Co-operation in Health Examination Surveys. 35 cents.
- No. 3. Hospital Utilization in the Last Year of Life. 30 cents.
- No. 4. Reporting of Hospitalization in the Health Interview Survey. 50 cents.
- No. 5. Health Interview Responses Compared With Medical Records. 45 cents.
- No. 6. Attitudes Toward Co-operation in a Health Examination Survey. 35 cents.
- No. 7. Evaluation of a Single-Visit Cardiovascular Examination. 30 cents.

Catalog Card

U. S. National Health Survey
