

Monthly Vital Statistics Report

Provisional Data From the CENTERS FOR DISEASE CONTROL AND PREVENTION/National Center for Health Statistics

Births, Marriages, Divorces, and Deaths for June 1997

Births

According to provisional reports, an estimated 323,000 births occurred in the United States during June 1997. This was a 6-percent increase from the provisional number of births reported for June 1996 (304,000). The birth rate, 14.7 live births per 1,000 population, was 5 percent higher than the rate of 14.0 for June 1996. The fertility rate, 65.7 live births per 1,000 women aged 15–44 years, was 6 percent higher than the comparable rate for June 1996 (62.2). The seasonally adjusted fertility rate (64.4) was also 6 percent higher than the comparable rate for June 1996 (61.0).

During the first half of 1996, an estimated 1,873,000 births occurred, a

1-percent decrease from the 1,889,000 reported for the first half of 1996. The birth rate for this period decreased by 2 percent from 14.4 in 1996 to 14.1 in 1997. The fertility rate for the first half of 1997 was 63.3, 1 percent lower than the rate for the first half of 1996 (63.8).

An estimated 3,883,000 live births occurred in the 12-month period ending with June 1997, an increase of 1 percent from the 3,853,000 births reported for the same period a year earlier. The birth rate of 14.6 was the same as the rate for the preceding 12-month period. The fertility rate for the most recent 12-month period was 65.1, 1 percent higher than the rate for the 12 months ending with June 1996 (64.7). This combination of a constant birth rate

and a higher fertility rate suggests a slow-down of the generally downward trend observed since early 1991.

Natural increase

As a result of natural increase, the excess of births over deaths, an estimated 141,000 people, or 6.4 persons per 1,000 population, were added to the population during June 1997.

For the 12-month period ending with June 1997, 1,587,000 persons were added to the population. This represented a rate of natural increase of 6.0, 3 percent higher than the rate of 5.8 for the preceding 12-month period. The rise in the rate of natural increase was due to a steady birth rate and a declining death rate.

Provisional Vital Statistics for the United States

[Rates for infant deaths are deaths under 1 year per 1,000 live births; fertility rates are live births per 1,000 women aged 15–44 years; all other rates are per 1,000 total population. Data are subject to monthly reporting variation; see [Technical notes](#)]

Item	June				January–June				12 months ending with June

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES
Centers for Disease Control and Prevention
National Center for Health Statistics

Marriages

There were an estimated 235,000 marriages performed in June 1997, 3 percent fewer than in June 1996 (242,000). The marriage rate per 1,000 population for June was 4 percent lower in 1997 (10.7) than in 1996 (11.2).

The number of marriages for the first half of 1997 was 1,109,000, 5 percent more than for the same period in 1996 (1,058,000). The marriage rate for January–June rose 5 percent, from 8.2 in 1996 to 8.6 in 1997.

The number of marriages performed during the 12 months ending with June 1997 (2,395,000) was 3 percent more than the number for the same period a year earlier (2,322,000). The marriage rate for the current 12-month period (9.0) was 2 percent higher than the rate for the comparable period ending with June 1996 (8.8).

Divorces

Approximately 99,000 divorces were granted during June 1997, 4 percent fewer than the number reported for June 1996 (103,000). The divorce rate per 1,000 population (4.5) for June 1997 was 6 percent lower than the rate for June 1996 (4.8).

The cumulative number of divorces for the first half of 1997 (578,000) was 1 percent higher than the number of divorces reported for the same period in 1996 (574,000). The divorce rate per 1,000 population (4.4) for January–June 1997 was the same as the rate for the 6-month period in 1996.

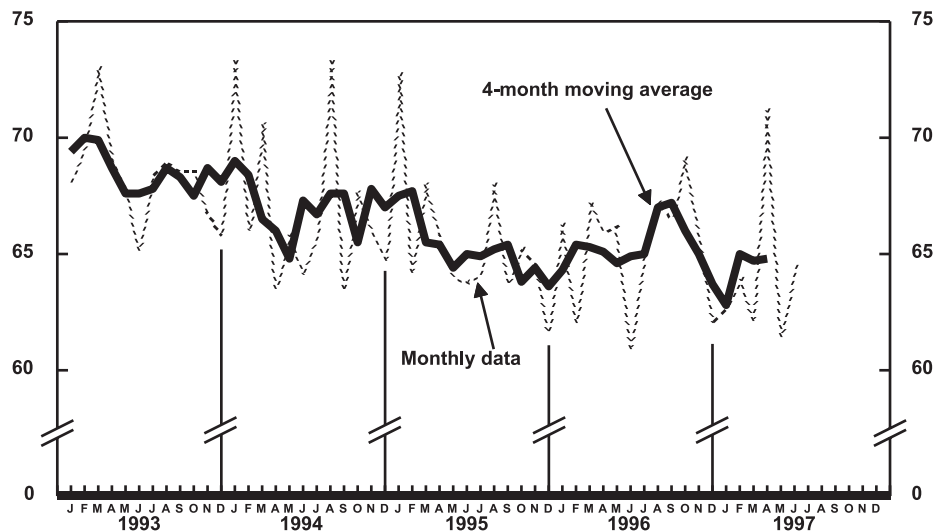

An estimated 1,154,000 divorces were granted during the 12-month period ending with June 1997, the same number that were granted during the same period a year earlier. However, the divorce rate for the period ending with June 1997 (4.3) was 2 percent lower than the rate for the period ending with June 1996 (4.4).

Deaths

For June 1997 there were an estimated 182,000 deaths in the United States. The death rate was 8.3 deaths per 1,000 population, 1 percent higher than the rate of 8.2 for June a year earlier. Among the 182,000 deaths for June 1997 were 2,100 deaths at ages under 1 year.

Provisional birth rates per 1,000 population by month: United States, 1995-97

Provisional seasonally adjusted fertility rates per 1,000 women aged 15-44 years: United States, 1993-97

Provisional marriage rates per 1,000 population by month: United States, 1995-97

According to provisional statistics, there were 1,172,000 deaths during the first half of 1997, 1 percent fewer than the number estimated for the first half of 1996 (1,187,000). The death rate, 8.9 per 1,000 population, was 1 percent lower than the rate for January–June 1996 (9.0). Among the 1,172,000 deaths for the first half of 1997 were 13,200 deaths at ages under 1 year, yielding an infant mortality rate of 7.0 per 1,000 live births. This rate was 7 percent lower than the rate of 7.5 for the first half of 1996.

The death rate for the 12 months ending with June 1997 was 8.6 deaths per 1,000 population, 2 percent lower than the rate for the comparable 12-month period a year earlier (8.8). The infant mortality rate for this 12-month period was 7.0 per 1,000 live births, 5 percent lower than the rate of 7.4 for the 12 months ending with June 1996.

Current Mortality Sample, 12 months ending with May 1997—The provisional death rate for the 12 months ending with May 1997 was 860.8 per 100,000 population, 1.8 percent lower than the rate for the 12-month period ending May 1996 (876.5). The provisional age-adjusted death rate for the 12-month period ending with May 1997 was 481.4 per 100,000 U.S. standard population, 3.5 percent lower than the rate of 499.0 for the 12-month period ending with May 1996. Age-adjusted death rates control for changes and variations in the age composition of the population; therefore, they are better indicators than crude rates for showing changes in mortality risk over time and for showing differences between race-sex groups within the population. Among the race-sex groups, the estimated age-adjusted death rates decreased for all four race-sex groups. By age the death rate for the total population decreased for all age groups except for Under 1 year, 5–14 years of age, and 85 years and over.

Among the major causes of death, the estimated death rate decreased between the two successive 12-month periods for Diseases of heart, Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, Homicide and legal intervention, and Human immunodeficiency virus infection. The decrease for Homicide and legal intervention was largely due to the decline in the rate for

Provisional death rates per 1,000 population by month: United States, 1995–97

Provisional infant mortality rates per 1,000 live births by month: United States, 1995–97

Provisional birth rates per 1,000 population for successive 12-month periods ending with month indicated: United States, 1993–97

homicide by firearms. The death rate increased between the two successive 12-month periods for Pneumonia and influenza.

The infant mortality rate for the 12 months ending with May 1997 was 708.2 per 100,000 live births, 4.5 percent lower than the rate of 741.7 for the same 12-month period a year earlier. For infants under 28 days of age, the 12-month rate ending May 1997 was 458.9 compared with a rate of 477.5 for the 12-month period a year earlier. The infant mortality rate for infants aged 28 days–11 months was 249.2 compared with a rate of 263.7 for the 12-month period a year earlier. The changes in the mortality rates for infants under 28 days of age and for those aged 28 days–11 months were not statistically significant. Among causes of infant death, the infant mortality rate decreased between the two successive 12-month periods for Birth trauma and Sudden infant death syndrome.

Provisional marriage rates per 1,000 population for successive 12-month periods ending with month indicated: United States, 1993–97

Provisional divorce rates per 1,000 population for successive 12-month periods ending with month indicated: United States, 1993–97

Provisional death rates per 1,000 population for successive 12-month periods ending with month indicated: United States, 1993-97

Provisional infant mortality rates per 1,000 live births for successive 12-month periods ending with month indicated: United States, 1993-97

Table 1. Provisional number of live births, marriages, divorces, deaths, and infant deaths and rates, by month: United States, January 1996–June 1997

Table 5. Provisional number of deaths and death rates, by age, race, and sex, and age-adjusted death rates by race and sex: United States, May 1996 and 1997, cumulative figures 1996 and 1997, and 12 months ending with May 1996 and 1997

[Data are provisional, estimated from a 10-percent sample of deaths. Age-specific rates on an annual basis per 100,000 population in specified group; age-adjusted rates per 100,000 U.S. standard population; see [Technical notes](#). Because of rounding of estimates, figures may not add to totals. For method of computation and information on standard errors of the estimates, see [Technical notes](#)]

Table 5. Provisional number of deaths and death rates, by age, race, and sex, and age-adjusted death rates by race and sex: United States, May 1996 and 1997, cumulative figures 1996 and 1997, and 12 months ending with May 1996 and 1997—Con.

[Data are provisional, estimated from a 10-percent sample of deaths. Age-specific rates on an annual basis per 100,000 population in specified group; age-adjusted rates per 100,000 U.S. standard population; see [Technical notes](#). Because of rounding of estimates, figures may not add to totals. For method of computation and information on standard errors of the estimates, see [Technical notes](#)]

Table 5. Provisional number of deaths and death rates, by age, race, and sex, and age-adjusted death rates by race and sex: United States, May 1996 and 1997, cumulative figures 1996 and 1997, and 12 months ending with May 1996 and 1997—Con.

[Data are provisional, estimated from a 10-percent sample of deaths. Age-specific rates on an annual basis per 100,000 population in specified group; age-adjusted rates per 100,000 U.S. standard population; see [Technical notes](#). Because of rounding of estimates, figures may not add to totals. For method of computation and information on standard errors of the estimates, see [Technical notes](#)]

... Category not applicable.

— Quantity zero.

¹Includes races other than white and black.

²Death rates under 1 year (based on population estimates) differ from infant mortality rates (based on live births); see [table 9](#) for infant mortality rates.

³For method of computation, see [Technical notes](#).

NOTES: Figures include all revisions received from the States. Cumulative and 12-month figures for the current year reflect revisions received for previous months, and figures for earlier years may differ from those previously published. Data include adjustments for Utah, which is not included in the sample for May 1997.

Table 6. Provisional number of deaths and death rates for 72 selected causes, Human immunodeficiency virus infection, and Alzheimer's disease: United States, May 1996 and 1997, cumulative figures 1996 and 1997, and 12 months ending with May 1996 and 1997

[Data are provisional, estimated from a 10-percent sample of deaths. Rates on an annual basis per 100,000 estimated population. Because of rounding of estimates, figures may not add to totals. For method of computation and information on standard errors of the estimates, see [Technical notes](#). For explanation of asterisks preceding cause-of-death categories, see [Technical notes](#)]

Technical notes

Nature and sources of data

Data in this report are provisional unless otherwise specified and include only events occurring within the United States (50 States and the District of Columbia). Mortality data exclude fetal deaths. Data for the Commonwealth of Puerto Rico are not included in the U.S. totals.

Birth, death, and infant death figures in [tables 2](#) and [4](#) for each State are estimates by State of residence. These estimates are derived by applying adjustment ratios to the actual counts of certificates for all events occurring in the State and received in registration offices during a 1-month period regardless of date of the event. The adjustment ratios for each data year represent the observed relationship between final State occurrence figures and final State residence figures for the three most recent years for which final data were available and are expressed as a single ratio for each State. As in previous years, monthly State marriage and divorce figures represent the actual count of all events occurring in the State (State of occurrence) that were received in the registration offices during the 1-month period. Delay in the receipt of certificates in a registration office may result in a low State figure for a given month followed by a high figure for the month(s) in which the delayed records are received. Data for previous months and cumulative data include revised figures received from the States.

Figures for births, deaths, and infant deaths for California in [tables 2](#) and [4](#) contain adjustments for varying lengths of State reporting periods. Figures for Texas for all events shown in [tables 2–4](#) also are adjusted for varying lengths of State reporting periods. The figures for both States are adjusted by the ratio between the number of days in the data month and the number of days in the State reporting period. The adjusted figures are included in the U.S. totals shown elsewhere in this report.

U.S. totals for births, deaths, and infant deaths are based on the State estimates by State of residence and, therefore, in effect, exclude events to nonresidents of the United States. Events to nonresidents of the United States are included in all

marriage and divorce figures. The effect of excluding events to nonresidents from the U.S. totals is small.

Provisional totals for the United States include estimates for State data shown as not available. Provisional totals for births and marriages for the entire United States include adjustments for observed differences between provisional and final monthly figures.

Divorce figures include reported annulments. The monthly national divorce estimate is obtained by multiplying the total for the reporting areas by the ratio observed between the most recent final annual divorce total for the United States and the provisional total for the reporting areas combined.

Random variation—Although the counts in this report are not subject to sampling variability (except the Current Mortality Sample), they may be affected by random variation. When the number of events is small and the probability of such an event is small, considerable caution must be observed in interpreting the data. Such infrequent events may be assumed to follow a Poisson probability distribution. For this distribution a simple approximation may be used to estimate the random variation as follows:

If N is the number of events in the population and R is the corresponding rate, the chances are 19 in 20 that

$$1. N - 2\sqrt{N} \text{ and } N + 2\sqrt{N}$$

covers the “true” number of events.

$$2. R - 2 \frac{R}{\sqrt{N}} \text{ and } R + 2 \frac{R}{\sqrt{N}}$$

covers the “true” rate.

If the rate R_1 corresponding to N_1 events is compared with the rate R_2 corresponding to N_2 events, the difference between the two rates may be regarded as statistically significant at the 0.05 level if it exceeds

$$2 \sqrt{\frac{R_1^2}{N_1} + \frac{R_2^2}{N_2}}$$

Additional information on random variation in numbers of events, rates, and ratios may be found in the technical appendixes of *Vital Statistics of the United States, 1992, Volumes I and II*.

Rates

Rates are on an annual basis and, except for infant mortality rates, are per 1,000 or 100,000 estimated population residing in the United States. The populations used for computing these rates are furnished by the U.S. Bureau of the Census. Rates shown in this report beginning with 1992 were computed using populations based on the 1990 Census enumeration comparable to those used for final data. Monthly rates are based on populations estimated for the specific month. Year-to-date rates are averages of monthly rates that have been weighted by the number of days in the corresponding months. Rates for 12-month periods are the sum of events for the period per population estimated at the midpoint of the period.

Infant mortality rates are deaths under 1 year of age for the specified period (monthly, year-to-date, or 12-month period) per 1,000 or 100,000 live births. Births used for computing monthly and year-to-date infant mortality rates are adjusted for monthly variation in the number of births. Births used to compute 12-month rates do not contain this adjustment. Births used for computing infant mortality rates are not corrected for observed differences between provisional and final monthly figures as described earlier in “[Nature and sources of data.](#)” Because monthly infant mortality rates are based on relatively few events, they are highly variable. Therefore, comparisons of monthly infant mortality rates should be interpreted cautiously; see “[Random variation.](#)”

Age-adjusted death rates are used to compare relative mortality risks across groups and over time. However, they should be viewed as constructs or indexes rather than as direct or actual measures of mortality risk. Statistically, they are weighted averages of the age-specific death rates, where the weights represent the fixed population proportions by age. See chapter 5 of an earlier report (1). The age-adjusted death rates presented in this report were computed by the direct method, that is, by applying age-specific death rates to the U.S. standard million population (2). See also chapter 10 of an earlier report (1). Age groups in [table 5](#) were used to compute the age-adjusted

rates shown in that table. It is important not to compare age-adjusted rates with crude rates.

Current Mortality Sample

The Current Mortality Sample (CMS) is a 10-percent systematic sample of death certificates drawn each month after the certificates are counted in the State registration offices. Deaths and death rates for the United States by age, race, sex, and cause are estimated based on the sample. Because of the additional time required to select and process the certificates, data based on the CMS are published 1 month after publication of the U.S. and State counts. Complete information concerning the underlying cause of death sometimes is not available when the sample is drawn. As a result estimates based on sample counts for certain causes are biased. Correction for bias is not made in this report.

Estimated numbers of deaths based on the sample were proportionately adjusted to be consistent with estimates based on the count of death certificates received in State registration offices.

HIV infection—Beginning with data for 1987, the National Center for Health Statistics introduced categories *042–*044 for classifying and coding Human immunodeficiency virus (HIV) infection. The asterisks before the categories indicate that these codes are not part of the

Ninth Revision, International Classification of Diseases. Deaths classified to these categories are included in All other infectious and parasitic diseases in the List of 72 Selected Causes of Death and are also shown separately at the bottom of table 6.

Sampling variability—Because the estimates of deaths and death rates presented in this report with the exception of total deaths and deaths under 1 year are based on a sample of death certificates, they are subject to sampling variability. The estimated relative standard error in the following table is a measure of the

Relative standard errors for estimated numbers of deaths from the Current Mortality Sample expressed as a percent of the estimate

Estimated number of deaths	Relative standard error of estimate (as percent)	
	170,000 estimated deaths each month	2,000,000 estimated deaths each year
10	94.9	94.9
20	67.1	67.1
50	42.4	42.4
100	30.0	30.0
200	21.2	21.2
500	13.4	13.4
1,000	9.5	9.5
2,000	6.7	6.7
5,000	4.2	4.2
10,000	2.9	3.0
20,000	2.0	2.1
50,000	1.1	1.3
100,000	0.6	0.9
200,000	0.6
500,000	0.4
1,000,000	0.2

sampling error of the estimated number of deaths (or of the estimated death rate) expressed as a percent of the estimate. The first column refers to monthly estimates; the second to annual; cumulative year-to-date totals fall between the two.

The chances are about 2 in 3 that the percent difference between an estimate and the result of a complete count is less than the percent shown. The chances are about 19 in 20 that the percent difference is less than twice the percent shown. A figure based on 100 or fewer estimated deaths has a relative standard error of 30 percent or more and is, therefore, considered unreliable. A rate based on 100 or fewer estimated deaths has been replaced by an asterisk.

Unless otherwise specified comparisons made in the text between death rates based on the CMS were statistically significant at the 0.05 level of significance. Lack of comment in the text about any two rates does not mean that the difference was tested and found not to be significant at this level.
