CHS Appendix

A Preliminary Evaluation and Recommendations for use of the Mental Health Indicator (MHI) in the NHIS for children ages 2 to 3

This is based on from a report by Thomas M.Achenbach, Ph.D., which was submitted to the Division of Health Interview Statistics on May 10, 1999.

Introduction

The NHIS mental health indicators, MHIBOY2 and MHIGRL2 are located in the Child Health Status (CHS) section of the survey, and are based on items from the Child Behavior Checklist (CBCL) that were identified by Dr. Thomas Achenbach as providing the best discrimination between demographically similar children referred for mental health services versus nonreferred (Achenbach and Edelbrock, 1983). To take account of gender and age differences in the discriminative power of particular items, the items were selected separately for each gender and age group. From the original ten items identified in Dr. Achenbach's 1995 analyses, the 1997 NHIS elected to include only 4 items (per gender). These include whether male sample children (aged 2-3 years) had been uncooperative, had trouble sleeping, had speech problems, or been unhappy or depressed in the past 2 months, and whether female sample children (aged 2-3 years) had temper tantrums, had speech problems, had been nervous or high-strung, or been unhappy or depressed in the past 2 months. Response categories included "Not true", "Sometimes true", or "Often true" (as well as "Refused" and "Don't know"). These items are also located in the CHS section (see CHS.321_01-03.000 and CHS.361_01-03.000).

It is essential to note that such a small set of items cannot be used to evaluate individual children for clinical or other purposes. Even for use as a mental health indicator in large surveys such as the NHIS, very small sets of items can serve only as approximate indicators of needs for mental health services. Multiple items tapping each of several specific areas of functioning would be needed to identify specific disorders, such as Attention Deficit Hyperactivity Disorder (ADHD), Depression, Conduct Disorder, and Somatization Disorder. (Note: The items for children ages 4 to 17 were replaced in the 2001 NHIS with a different instrument, the Strengths and Difficulties Questionnaire (SDQ). The SDQ is described in Appendix V.)

It should also be noted that different cutpoints on the distributions of item scores may be needed for different purposes. For example, a very low cutpoint may be useful if the goal is to identify every possible case for which mental health services might be considered. However, very low cutpoints result in relatively high false positive rates, i.e., the inclusion of substantial numbers of healthy individuals among those identified as potentially needing services. Conversely, higher cutpoints may yield greater overall accuracy in classifying potential cases versus noncases, but at the cost of missing more cases potentially needing services.

Data Analyses

Dr. Achenbach specified and reviewed data analyses that were done at NCHS. These included tabulations of specific responses to each behavioral/emotional problem item; tabulations of relations between total problem scores and classification of children as deviant versus nondeviant on the basis of external criteria (e.g., parents ever being told by health professionals that their child had ADHD, mental retardation, other developmental delay, autism, down syndrome, or a learning disability; parents having talked to mental health professionals about their child in the preceding 12 months; or parents needing mental health services for their child but unable to afford it); and Relative Operating Characteristic (ROC) analyses of cutpoints on the total problem scores. Because each behavioral/emotional problem item was scored “0” (not true of the child), “1” (somewhat or sometimes true), or “2” (very true or often true), total scores across the 4 items for each gender/age group could range from “0” to “8”. Dr. Achenbach examined the results and recommended changes and additions to the analyses.

Based on the analyses to date, Dr. Achenbach makes the following recommendations for boys and girls ages 2-3. Total scores on the 8 problem items are useful for quantitative analyses in relation to other variables. However, categorical mental health indicators should not be derived from specific cutpoints on the total scores for the 4 behavioral/emotional problem items on the basis of 1997 NHIS data for ages 2-3 for the following reasons:

The total number of children, 44 boys and 27 girls, classified as deviant according to external criteria (e.g., parents being told their child had ADHD; talking to mental health professionals about their child) was too small to provide a sound basis for establishing cutpoints;

Many disorders relevant to defining criterion groups (e.g., ADHD) are not identified as early as age 2-3;

The rates of referral for mental health services and other possible indicators of deviance are much lower at ages 2-3 than at older ages.

CMH Appendix

The Strengths and Difficulties Questionnaire (SDQ)

The Strengths and Difficulties Questionnaire (SDQ) was developed and copyrighted by Dr. Robert Goodman, Institute of Psychiatry, London, England. It is used in the NHIS with Dr. Goodman's permission. The parent respondent version of the SDQ was added as a mental health supplement for children ages 4-17 as a part of a collaborative agreement between NCHS and the National Institute of Mental Health (NIMH). The first part of the SDQ consists of 25 scale items; the source questions for these items are located in the Child Mental Health (CMH) section of the 2004 NHIS (please refer to items CMH.010._01.00 through CMH.050_05.00). These items can be divided into five subscales measuring the following psychological attributes or dimensions:

- emotional symptoms;
- conduct problems;
- hyperactive behavior;
- peer relationships;
- prosocial behavior.

The second part of the SDQ, the extended questions (items CMH.060_00.000 through CMH.100_00.000), obtains additional information about the duration and impact of symptoms, which can be useful for determining psychiatric caseness. Scoring of the SDQ is described below.

The SDQ has been validated in studies done in Britain, and studies are currently being planned to evaluate the SDQ among U. S. adolescents aged 15-17 years. Validation studies among U. S. children aged 4-14 years are not yet available. Further information on the SDQ, including information on the teacher and self-respondent versions of the SDQ, is available at the web site: <<http://www.sdqinfo.com>>.

Scoring of the SDQ

The five subscales described above can be scored separately to look at specific psychological problems, or the items in the first four subscales can be added for an overall score of 0-40. The scoring used has been:

<u>Emotional symptoms:</u>	Not true	Somewhat true	Definitely true
Often complains of headaches, stomach-aches, or sickness	0	1	2
Many worries, often seems worried	0	1	2
Often unhappy, depressed or tearful	0	1	2
Nervous or clingy in new situations	0	1	2
Many fears, easily scared	0	1	2

<u>Conduct problems:</u>	Not true	Somewhat true	Definitely true
Often has temper tantrums or a hot temper	0	1	2
Generally obedient, usually does what parents want	2	1	0
Often fights with other children or bullies	0	1	2
Often lies or cheats	0	1	2
Steals from home, school, or elsewhere	0	1	2
<u>Hyperactivity behavior:</u>			
Restless, overactive, cannot stay still for long	0	1	2
Constantly fidgeting or squirming	0	1	2
Easily distracted, concentration wanders	0	1	2
Thinks things out before acting	2	1	0
Sees task through to the end, good attention span	2	1	0
<u>Peer relationships:</u>			
Rather solitary, tends to play alone	0	1	2
Has at least one good friend	2	1	0
Generally liked by other children	2	1	0
Picked on or bullied by other children	0	1	2
Gets on better with adults than other children	0	1	2

The fifth subscale, the Prosocial subscale, describes children's *positive* behaviors. These items are excluded from the overall SDQ scoring when using the SDQ to identify children with psychological problems. The Prosocial subscale can be scored as follows:

<u>Prosocial behavior:</u>	Not true	Somewhat true	Definitely true
Considerate of other people's feelings	0	1	2
Shares readily with other children	0	1	2
Helpful if someone is hurt, upset, or feeling ill	0	1	2
Kind to younger children	0	1	2
Often volunteers to help others	0	1	2
