ACKNOWLEDGMENTS

This publication and the vital statistics computer file on which it is based were prepared by staff from the Division of Vital Statistics, Division of Data Processing, Division of Data Services, and the Office of Research and Methodology.

The Division of Vital Statistics, John E. Patterson, Director (retired), Lester R. Curtin, Acting Director, and James A. Weed, Deputy Director, managed the Vital Statistics Cooperative Program, through which the vital registration offices of all States, the District of Columbia, New York City, Puerto Rico, Virgin Islands, and Guam provided the data to the National Center for Health Statistics. This Division also processed computer edits, designed and programmed the tabulations, reviewed the data, and prepared documentation for this publication. The following branch chiefs provided overall direction: Ronald F. Chamblee, Joseph D. Farrell, George A. Gay, Harry M. Rosenberg, and Mabel G. Smith. Important contributors were Evangeline D. Adams, Joyce A. Arbertha, Judy M. Barnes, Heidi A. Brotherton, Leola Drake, Thomas D. Dunn, Linda L. Elias, Paula Gardner, Brenda S. Gillum, Donna E. Glenn, Donna L. Hoyert, Bettie L. Hudson, Millie B. Johnson, Virginia J. Justice, Kenneth D. Kochanek, Julia L. Kowaleski, Hsiang-Ching Kung, Wilma C. Latta, Marian F. MacDorman, Jeffrey D. Maurer, Mary J. Oakley, Charles E. Royer, Jordan S. Sacks, Ann F. Scarlett, Manju Sharma, Gopal K. Singh, Elsie A. Stanton, George C. Tolson, Irene H. Towns, and Lacola Washington.

The Division of Data Processing, Gerald C. Sanders, Director, and Howard Paris, Deputy Director, was responsible for receipt and processing of the basic data file. The following management staff provided overall direction: Brenda L. Brown, Mary V. Burt, Carl G. Hicks, June S. Pearce, Portia D. Prevo, Linda B. Torian, and Shirley C. Turbiville. Important contributors were Tyinga L. Ambrose, Rosalyn R. Anderson, Susan T. Autry, Joyce L. Bius, Trina L. Bryant, Frances E. Carter, Shirley Carter, Shirley Croy, Linda P. Currin, Jacqueline Davis, Connie M. Gentry, Lillian M. Guettler, Lila W. Hales, Linda O. Harper, Audrey S. Johnson, Katheryn G. Lyndon, Carolyn H. Lyons, Janet L. McBride, Susan L. McBroom, Mary Susan McKelvey, Roy H. Peedin, Mae G. Penny, Rodney Pierson, Tanya W. Pitts, Lois L. Poole, Julia E. Raynor, Gwendolyn E. Robbins, Helen H. Rogerson, Claire Searl, Eldora Smith, Elizabeth A. Smith, Pamela A. Stephenson, Betty J. Stewart, Leslie J. Stewart, Betsy B. Thompson, Elizabeth A. Walston, Carolyn R. Watkins, Teresa M. Watkins, Faye L. Webster, James G. Williams, Patricia W. Dunham, and Karen M. Wooten.

The Division of Data Services, Phillip R. Beattie, Director, and Margot A. Palmer, Deputy Director, was responsible for publications management, production, editorial review, and printing. The following branch and section chiefs provided overall direction: Richard L. Welch, Naomi M. Forester, and Rolfe W. Larson. Important contributors were Arlett R. Brown, Joan Burton, Jarmila G. Frazier, Patricia Keaton-Williams, Zung Le, Demarius Miller, and Patricia Wilson.

The Office of Research and Methodology was responsible for the application of mathematical statistics methods to the development and implementation of quality assurance procedures. Important contributions in this area were made by Kenneth W. Harris, Special Assistant for Data Policy and Coordination.

The National Center for Health Statistics acknowledges the essential role of the vital registration offices of all States and territories in maintaining the system through which vital statistics data are obtained and for their cooperation in providing the information on which this publication is based.

6-1. Abridged life tables by race and sex: United States, 1990	7
6-2. Number of survivors at single years of age, out of 100,000 born alive, by race and sex: United States, 1990	11
6-3. Expectation of life at single years of age, by race and sex: United States, 1990	12
6-4. Life table values by race and sex: Death-registration States, 1900–1902 to 1919–21, and United States, 1929–31 to 1990	13
6-5. Estimated average length of life in years, by race and sex: Death-registration States, 1900–28, and United States, 1929–90	19

Death rates for a specific period may be summarized by the life table method to obtain measures of comparative longevity. There are two types of life tables—the generation or cohort life table and the current life table.

The generation life table provides a “longitudinal” perspective in that it follows the mortality experience of a particular cohort, all persons born in the year 1900, for example, from the moment of birth through consecutive ages in successive calendar years. Based on age-specific death rates observed through consecutive calendar years, the generation life table reflects the mortality experience of an actual cohort from birth until no lives remain in the group. To prepare just a single complete generation life table requires data over many years. It is not feasible to construct generation life tables entirely on the basis of actual data for cohorts born in this century (1). It is necessary to project data for the incomplete period for cohorts whose life spans are not yet complete (2).

The better-known current life table may, in contrast, be characterized as “cross sectional.” Unlike the generation life table, the current life table does not represent the mortality experience of an actual cohort. Rather, the current life table considers a hypothetical cohort and assumes that it is subject to the age-specific death rates observed for an actual population during a particular period. Thus, for example, a current life table for 1990 assumes a hypothetical cohort subject throughout its lifetime to the age-specific death rates prevailing for the actual population in 1990. The current life table may thus be characterized as rendering a “snapshot” of current mortality experience, and shows the long-range implications of a set of age-specific death rates that prevailed in a given year. In this section the term “life table” refers only to the current life table and not to the generation life table.

The life table program

Three series of life tables are prepared by the National Center for Health Statistics—complete, provisional abridged, and final abridged. The complete life tables for the U.S. population contain life table values for single years of age. They are based on decennial census data and deaths for a 3-year period around the census year and have been prepared since 1900. The provisional abridged life tables contain values by 5-year age groups and are based on a 10-percent sample of deaths. The final abridged life tables (referred to in this section as “abridged life tables”) also contain values by 5-year age groups but are based on a complete count of all reported deaths.

In response to a growing number of requests for postcensal life table values, a series of abridged life tables was

initiated in 1945. Available annually since that year, the abridged life tables are based on deaths occurring during the calendar year and on midyear postcensal population estimates provided by the U.S. Bureau of the Census. Refinements in both the techniques for estimating the population and the methods for constructing abridged life tables permit these tables to be prepared in a way that provides reasonably accurate data on current trends in expectation of life and survivorship. Beginning with 1945, abridged life tables have been constructed by reference to a standard table (3). Methodology developed by Greville was used in constructing life tables for 1945–52. Since 1953 a modified method has been employed (4). U.S. life tables for the decennial period 1979–81 are used as the standard table in constructing the 1990 abridged life tables.

The 1945 abridged life tables were prepared for white and all other males and females. Since 1946 abridged life tables for the total population have also been available, and since 1948 abridged life tables have been calculated for total males and total females. Beginning with 1951, additional abridged life tables have been calculated for the total white and total all other populations.

Numerous requests have been received annually for current life table statistics that are more detailed than those available in the abridged life tables. Therefore, tables showing l_x and e_x values by single years of age interpolated from the abridged life tables have been published since 1960.

The demand for information regarding up-to-date life table values was responsible for the introduction of a third series, provisional abridged life tables. Beginning with 1958, provisional abridged life tables have been published, for the total population only, in the “Annual Summary of Births, Marriages, Divorces, and Deaths, United States,” *Monthly Vital Statistics Report*; unpublished provisional life table data by race and sex are also produced annually. Values in these life tables are based on population estimates provided by the U.S. Bureau of the Census and on the estimated number of deaths derived from the Current Mortality Sample (CMS). The CMS consists of one-tenth of the death certificates filed in the vital statistics registration offices of each State, the District of Columbia, and New York City. The sample is taken by selecting 1 of every 10 death certificates received between two dates a month apart, regardless of the month or year in which the death occurred.

Life table values

The data used to prepare the abridged U.S. life tables for 1990 are the final mortality statistics and the April 1, 1990,

¹Life table values are revised and, therefore, may differ from those published in *Vital Statistics of the United States, 1989 Life Tables, Volume II, Section 6* and earlier years.

census enumeration by age, race, and sex prepared by the U.S. Bureau of the Census. Selected life table values for 1900–1902, 1959–61, 1969–71, 1979–81, 1989, and 1990 are shown in tables A and B.

Expectation of life—The most frequently used life table statistic is life expectancy (e_x), which is the average number of years of life remaining for persons who have attained a given age (x). Life expectancy and other life table values at specified ages in 1990 are shown for the total population and by race and sex in table 6-1. In addition, life expectancies at single years of age by race and sex are shown in table 6-3.

Life expectancy at birth for 1990 for the total population was 75.4 years. This represents the average number of years that the members of the life table cohort may expect to live at the time of birth (tables A and 6-1).

Survivors to specified ages—Another way of assessing the longevity of the life table cohort is by determining the proportion who survive to specified ages. The l_x column provides the data for computing the proportion. For instance, for the total population, 79,590 out of the original 1990 life table cohort of 100,000 (or 79.6 percent) were alive at exact age 65 (tables B and 6-2).

Median length of life—In addition to determining the proportion alive at a specified age, one can also compute the median age at death, the age at which exactly half the cohort (50,000 persons) still remain alive and half have died. For example, in 1990 the median age at death for the total population was 79.0 years (table B).

Trends and comparisons

In 1990 life expectancy at birth reached a record high of 75.4 years. This continued the general upward trend in life expectancy in the United States.

The expectation of life at birth for 1990 represents the average number of years that a group of infants born in 1990 would expect to live if the infants were to experience throughout their life the age-specific death rates prevailing in 1990. In 1990 life expectancy at birth for females was 78.8 years compared with 71.8 years for males; both figures represent increases over 1989 (table A). The difference in life expectancy between the sexes was 7.0 years in 1990, higher than the difference of 6.8 years in 1989. Historically, the difference in life expectancy between the sexes has narrowed since 1979, in

¹Life table values are revised and, therefore, may differ from those published in *Vital Statistics of the United States, 1989 Life Tables, Volume II Section 6* and earlier years.

contrast to widening from 1900 to 1972. The difference was 6.8 years in 1989 compared with 7.1 years in 1984, 7.8 years in 1975, 7.7 years and 7.8 years throughout the period 1972–79, 6.5 years in 1960, and 2.0 years in 1900.

Between 1989 and 1990 life expectancy for the white population increased from 75.9 years to a record high of 76.1 years, and for the black population from 68.8 years to 69.1 years. Although the difference in life expectancy between the black and white population narrowed from 7.6 years in 1970 to 5.7 years in 1982, it increased to 7.1 years in 1989 before declining to 7.0 years in 1990.

Among the four race-sex groups (white males and females; black males and females), white females continued to have the highest life expectancy at birth (79.4 years), followed by black females (73.6 years), white males (72.7 years), and black males (64.5 years) (table A). Between 1989 and 1990, life expectancy increased for black males (from 64.3 years in 1989 to 64.5 years in 1990) and for black females (from 73.3 years in 1989 to 73.6 years in 1990). Between 1984 and 1989, life expectancy for black males declined every year and, although life expectancy for black males increased between 1989 and 1990, it is still 0.8 years below the peak life expectancy of 65.3 years attained in 1984. Life expectancy for

black females has fluctuated since 1982, showing no clear trend. Between 1985 and 1990, life expectancy at birth increased each year for white males; for white females, it increased for 4 of the 5 years; for black females, for 2 of the 5 years; and for black males, life expectancy decreased for 4 of the 5 years (table C). Overall, the largest gain in life expectancy between 1980 and 1990 was for white males (2.0 years), followed by white females (1.3 years), black females (1.1 years), and black males (0.7 years).

The 1990 life table can be used to compare life expectancies at any age from birth onward. For example, a person who has reached age 65 years may look forward to living to an older age, on the average, than one who has reached age 50 years. On the basis of mortality experienced in 1990, a person aged 50 years could expect to live an average of 29.0 more years for a total of 79.0 years, and a person aged 65 years could expect to live an average of 17.2 more years for a total of 82.2 years (table A).

Life expectancy differences between males and females widened for many years after the beginning of the century, but recently the differences have narrowed for the white population and have widened for the black population (table D). For the white population the difference between males and females

¹Life table values are revised and, therefore, may differ from those published in *Vital Statistics of the United States, 1989 Life Tables, Volume II, Section 6* and earlier years.

increased from 2.9 years in 1900–1902 to 7.6 years by 1969–71; the difference has narrowed to 6.7 years for 1988–90. For the black population, the difference increased from 2.5 years in 1900–1902 to 8.8 years by 1979–81; it narrowed to 8.3 years by 1984, and increased to 9.1 years in 1990.

Technical appendix

The geographic areas covered in life tables before 1929–31 were limited to the death-registration areas. Life tables for 1900–1902 and 1909–11 were constructed using mortality data from the 1900 death-registration States (10 States and the District of Columbia) and for 1919–21 from the 1920 death-registration States (34 States and the District of Columbia). The tables for 1929–31 through 1958 cover the conterminous United States. Decennial life table values for the 3-year period 1959–61 were derived from data which include both Alaska and Hawaii for each year (table 6-4). Data for each year shown in table 6-5 include Alaska beginning in 1959 and Hawaii beginning in 1960. However, it is not believed that the inclusion of these two States materially affects life table values.

Revised life table values, 1961–89—Life table values for 1960–69, 1970–79, and 1980–89 are constructed using the U.S. decennial life tables for 1959–61, 1969–71, and 1979–81, respectively, as the standard tables. The life table values for 1981–89 appearing in this publication are based on revised intercensal estimates of the populations for those years. As a result, the life table values for 1981–89 may differ from the life table values for those years published in *Vital Statistics of the United States* for 1989 and earlier years.

New Jersey data, 1962–64—The life tables for 1962 and 1963 for the six population groups involving race do not include data from New Jersey. This State omitted the item on race from its certificates of live birth, death, and fetal death in use at the beginning of 1962. The item was restored during the latter part of 1962. However, the certificate revision without this item was used for most of 1962 as well as for 1963. For computing vital rates, populations by age, race, and sex (excluding New Jersey) were estimated to obtain comparable denominators. Approximately 7 percent of the New Jersey death records for 1964 did not contain the race designation. When the records were being electronically processed for this

State, the “race not stated” deaths were allocated to white or to black.

Nonresidents—Beginning in 1970 the deaths of nonresidents of the United States have been excluded from the life table statistics.

Estimates for single calendar years—There has been an increasing interest in data on the average length of life (e_x) for single calendar years prior to 1945, when the annual abridged life table series was initiated. The figures in table 6-5 for groups by race and sex for the following years were estimated to meet these needs (5).

Years	Race and sex
1900-45	Total
1900-47	Male
1900-47	Female
1900-50	White
1900-44	White male
1900-44	White female
1900-50	All other
1900-44	All other male
1900-44	All other female

Population bases for computing life tables

The population used for computing life table values in this section (furnished by the U.S. Bureau of the Census) represents the resident population of the United States. The populations used for computing the 1990 life table values are based on the April 1, 1990, census enumeration (6). The 1990 census counts by race and age were modified. Race was modified to be consistent with the Office of Management and Budget categories and historical categories for mortality data. The modification procedures for race and age are described in the census report (7).

Life table values in this report for 1981-89 are based on revised populations that are consistent with the 1990 census level (7). They are, therefore, not comparable with rates published in previous years.

Explanation of the columns of the life table

Column 1—Age interval (x to $x + n$)—This column shows the age interval between the two exact ages indicated. For instance, “20-25” means the 5-year interval between the 20th and 25th birthdays.

Column 2—Proportion dying (${}_nq_x$)—This column shows the proportion of the cohort who are alive at the beginning of an indicated age interval and who will die before reaching the end of that age interval. For example, for males in the age interval 20-25, the proportion dying is 0.00828: Out of every 1,000 males alive and exactly 20 years of age at the beginning of the period, about 8 will die before reaching their 25th birthday. In other words, the ${}_nq_x$ values represent probabilities that persons who are alive at the beginning of a specific age interval will die before reaching the beginning of the next age

interval. The “proportion dying” column forms the basis of the life table. The life table is so constructed that all other columns are derived from it.

Column 3—Number surviving (l_x)—This column shows the number of persons, starting with a cohort of 100,000 live births, who survive to the exact age marking the beginning of each age interval. The l_x values are computed from the ${}_nq_x$ values, which are successively applied to the remainder of the original 100,000 persons still alive at the beginning of each age interval. Thus out of 100,000 male babies born alive, 98,969 will complete the first year of life and enter the second; 98,765 will begin the sixth year; 97,863 will reach age 20; and 21,962 will live to age 85.

Column 4—Number dying (${}_nd_x$)—This column shows the number dying in each successive age interval out of 100,000 live births. Out of 100,000 males born alive, 1,031 will die in the first year of life; 204 in the succeeding 4 years; 811 in the 5-year period between exact ages 20 and 25, and 21,962 will die after reaching age 85. Each figure in column 4 is the difference between two successive figures in column 3.

Columns 5 and 6—Stationary population (${}_nL_x$ and T_x)—Suppose that a group of 100,000 individuals like that assumed in columns 3 and 4 is born every year and that the proportions dying in each such group in each age interval throughout the lives of the members are exactly those shown in column 2. If there were no migration and if the births were evenly distributed over the calendar year, the survivors of these births would make up what is called a stationary population—stationary because in such a population the number of persons living in any given age group would never change. When individuals left the group, either by death or by growing older and entering the next higher age group, their places would immediately be taken by persons entering from the next lower age group. Thus a census taken at any time in such a stationary community would always show the same total population and the same numerical distribution of that population among the various age groups. In such a stationary population supported by 100,000 annual births, column 3 shows the number of persons who, each year, reach the birthday that marks the beginning of the age interval indicated in column 1, and column 4 shows the number of persons who die each year in the indicated age interval.

Column 5 shows the number of persons in the stationary population in the indicated age interval. For example, the figure given for males in the age interval 20-25 years is 487,331. This means that in a stationary population of males supported by 100,000 annual births and with proportions dying in each age group always in accordance with column 2, a census taken on any date would show 487,331 persons between exact ages 20 and 25 years.

Column 6 shows the total number of persons in the stationary population (column 5) in the indicated age interval and all subsequent age intervals. For example, in the stationary population of males referred to in the last illustration, column 6 shows that there would be at any given moment a total of 5,211,935 persons who have passed their 20th birthday. The

male population at all ages 0 and above (the total male population of the stationary community) would be 7,183,880.

Column 7—Average remaining lifetime (e_x)—The average remaining lifetime (also called expectation of life) at any given age is the average number of years remaining to be lived by those surviving to that age on the basis of a given set of age-specific rates of dying. To arrive at this value, it is first necessary to observe that the figures in column 5 of the life table can also be interpreted in terms of a single life table cohort without introducing the concept of the stationary population. From this point of view, each figure in column 5 represents the total time (in years) lived between two indicated birthdays by all those reaching the earlier birthday among the survivors of a cohort of 100,000 live births. Thus the figure 487,331 for males in the age interval 20–25 is the total number of years lived between the 20th and 25th birthdays by the 97,863 (column 3) who reached the 20th birthday out of 100,000 males born alive. The corresponding figure 5,211,935 in column 6 is the total number of years lived after attaining age 20 by the 97,863 reaching that age. This number of years divided by the number of persons (5,211,935 divided by 97,863) gives 53.3 years as the average remaining lifetime of males at age 20.

SECTION 6 - LIFE TABLES - PAGE 13

Table 6-4. Life Table Values by Race and Sex: Death-Registration States, 1900-1902 to 1919-21, and United States, 1929-31 to 1990
 (Page 1 of 6)
 [Alaska and Hawaii included beginning in 1959. For decennial periods prior to 1929-31, data are for groups of registration States as follows: 1900-1902 and 1909-11, 10 States and the District of Columbia; 1919-21, 34 States and the District of Columbia. Beginning 1970 excludes deaths of nonresidents of the United States; see Technical Appendix]

Age, race, and sex	Number of survivors out of 100,000 born alive (<i>l_x</i>)									
	1990	1979-81	1969-71	1959-61	1949-51	1939-41	1929-31	1919-21	1909-11	1900-1902

SECTION 6 - LIFE TABLES - PAGE 14

Table 6-4. Life Table Values by Race and Sex: Death-Registration States, 1900-1902 to 1919-21, and United States, 1929-31 to 1990—Con.
(Page 2 of 6)

[Alaska and Hawaii included beginning in 1959. For decennial periods prior to 1929-31, data are for groups of registration States as follows: 1900-1902 and 1909-11, 10 States and the District of Columbia; 1919-21, 34 States and the District of Columbia. Beginning 1970 excludes deaths of nonresidents of the United States; see Technical Appendix]

SECTION 6 - LIFE TABLES - PAGE 16

Table 6-4. Life Table Values by Race and Sex: Death-Registration States, 1900-1902 to 1919-21, and United States, 1929-31 to 1990—Con.

(Page 4 of 6)

[Alaska and Hawaii included beginning in 1959. For decennial periods prior to 1929-31, data are for groups of registration States as follows: 1900-1902 and 1909-11, 10 States and the District of Columbia; 1919-21, 34 States and the District of Columbia. Beginning 1970 excludes deaths of nonresidents of the United States; see Technical Appendix.]

¹ Alaska included in 1959 and Hawaii in 1960.

² Life table values are revised and, therefore, may differ from those published in "Vital Statistics of the United States", Vol. II, Mortality, Part A for 1989 and earlier years; see Technical Appendix.

³ Deaths based on a 50-percent sample.

⁴ Figures by race exclude data for residents of New Jersey; see Technical Appendix.
