Mortality Surveillance System: Models From the Second Year

Series 20:
Data From the National Vital Statistics System
No. 22

This report describes the Mortality Surveillance System and presents the statistical charts and text from its second year as published in the 12 issues of the *Monthly Vital Statistics Report*, volume 39, number 2 — volume 40, number 1.

Topics for the second year of the Mortality Surveillance System: MVSr issues, volume 39, number 2–volume 40, number 1	2
---	---

List of figures

1. Infant mortality rates per 100,000 live births, by month: United States, 1982–89	6
2. Neonatal mortality rates per 100,000 live births, by month: United States, 1982–89	6
3. Postneonatal mortality rates per 100,000 live births, by month: United States, 1982–89	7
4. Infant mortality rates per 100,000 live births for Congenital anomalies, by month: United States, 1982–89	7
5. Infant mortality rates per 100,000 live births for Sudden infant death syndrome, by month: United States, 1982–89	8
6. Infant mortality rates per 100,000 live births for Respiratory distress syndrome, by month: United States, 1982–89	8
7. Death rates per 100,000 females 25–44 years of age for Diseases of heart, by month: United States, 1982–89	9
8. Death rates per 100,000 males 25–44 years of age for Diseases of heart, by month: United States, 1982–89	9
9. Death rates per 100,000 females 45–64 years of age for Diseases of heart, by month: United States, 1982–89	10
10. Death rates per 100,000 males 45–64 years of age for Diseases of heart, by month: United States, 1982–89	10
11. Death rates per 100,000 females 65–74 years of age for Diseases of heart, by month: United States, 1982–89	11
12. Death rates per 100,000 males 65–74 years of age for Diseases of heart, by month: United States, 1982–89	11
13. Death rates per 100,000 females 45–64 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983–90	12
14. Death rates per 100,000 males 45–64 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983–90	12
15. Death rates per 100,000 females 65–74 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983–90	13
16. Death rates per 100,000 males 65–74 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983–90	13
17. Death rates per 100,000 females 45–64 years of age for Chronic liver disease and cirrhosis, by month: United States, 1983–90	14
18. Death rates per 100,000 males 45–64 years of age for Chronic liver disease and cirrhosis, by month: United States, 1983–90	14
19. Death rates per 100,000 females 45–64 years of age for Cerebrovascular diseases, by month: United States, 1983–90	15

20. Death rates per 100,000 males 45–64 years of age for Cerebrovascular diseases, by month: United States, 1983–90	15
21. Death rates per 100,000 females 65–74 years of age for Cerebrovascular diseases, by month: United States, 1983–90	16
22. Death rates per 100,000 males 65–74 years of age for Cerebrovascular diseases, by month: United States, 1983–90	16
23. Death rates per 100,000 females 75–84 years of age for Cerebrovascular disease, by month: United States, 1983–90 . . .	17
24. Death rates per 100,000 males 75–84 years of age for Cerebrovascular disease, by month: United States, 1983–90	17
25. Death rates per 100,000 females 25–44 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983–90	18
26. Death rates per 100,000 males 25–44 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983–90	18
27. Death rates per 100,000 females 45–64 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983–90	19
28. Death rates per 100,000 males 45–64 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983–90	19
29. Death rates per 100,000 females 65–74 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983–90	20
30. Death rates per 100,000 males 65–74 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983–90	20
31. Death rates per 100,000 females 45–64 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983–90	21
32. Death rates per 100,000 males 45–64 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983–90	21
33. Death rates per 100,000 females 65–74 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983–90	22
34. Death rates per 100,000 males 65–74 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983–90	22
35. Death rates per 100,000 females 45–64 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States, 1983–90	23
36. Death rates per 100,000 females 45–64 years of age for Malignant neoplasm of breast, by month: United States, 1983–90	23
37. Death rates per 100,000 females 45–64 years of age for Diabetes mellitus, by month: United States, 1983–90	24
38. Death rates per 100,000 males 45–64 years of age for Diabetes mellitus, by month: United States, 1983–90	24
39. Death rates per 100,000 females 65–74 years of age for Diabetes mellitus, by month: United States, 1983–90	25
40. Death rates per 100,000 males 65–74 years of age for Diabetes mellitus, by month: United States, 1983–90	25
41. Death rates per 100,000 females 65–74 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States 1983–90	26
42. Death rates per 100,000 females 65–74 years of age for Malignant neoplasm of breast, by month: United States, 1983–90	26
43. Death rates per 100,000 females 45–74 years of age for Malignant neoplasms of urinary organs, by month: United States, 1983–90	27
44. Death rates per 100,000 males 45–74 years of age for Malignant neoplasms of urinary organs, by month: United States, 1983–90	27
45. Death rates per 100,000 males 45–64 years of age for Malignant neoplasm of prostate, by month: United States, 1983–90	28
46. Death rates per 100,000 males 65–74 years of age for Malignant neoplasm of prostate, by month: United States, 1983–90	28
47. Death rates per 100,000 females 45–64 years of age for Malignant neoplasm of ovary, by month: United States, 1983–90	29
48. Death rates per 100,000 females 65–74 years of age for Malignant neoplasm of ovary, by month: United States, 1983–90	29
49. Death rates per 100,000 females 25–64 years of age for Pneumonia and influenza, by month: United States, 1983–90	30
50. Death rates per 100,000 males 25–64 years of age for Pneumonia and influenza, by month: United States, 1983–90	30
51. Death rates per 100,000 females 65–74 years of age for Pneumonia and influenza, by month: United States, 1983–90	31
52. Death rates per 100,000 males 65–74 years of age for Pneumonia and influenza, by month: United States, 1983–90	31
53. Death rates per 100,000 males 45–54 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States, 1983–90	32

54. Death rates per 100,000 males 55–64 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States, 1983–90	32
55. Death rates per 100,000 females under 15 years of age for Motor vehicle accidents, by month: United States, 1983–90	33
56. Death rates per 100,000 males under 15 years of age for Motor vehicle accidents, by month: United States, 1983–90	33
57. Death rates per 100,000 females 25–44 years of age for Motor vehicle accidents, by month: United States, 1983–90 ...	34
58. Death rates per 100,000 males 25–44 years of age for Motor vehicle accidents, by month: United States, 1983–90.....	34
59. Death rates per 100,000 females 45–64 years of age for Motor vehicle accidents, by month: United States, 1983–90 ...	35
60. Death rates per 100,000 males 45–64 years of age for Motor vehicle accidents, by month: United States, 1983–90.....	35
61. Death rates per 100,000 females 15–24 years of age for Motor vehicle accidents, by month: United States, 1983–90 ...	36
62. Death rates per 100,000 males 15–24 years of age for Motor vehicle accidents, by month: United States, 1983–90.....	36
63. Death rates per 100,000 females 15–24 years of age for Homicide and legal intervention, by month: United States, 1983–90	37
64. Death rates per 100,000 males 15–24 years of age for Homicide and legal intervention, by month: United States, 1983–90	37
65. Death rates per 100,000 females 15–24 years of age for Suicide, by month: United States, 1983–90.....	38
66. Death rates per 100,000 males 15–24 years of age for Suicide, by month: United States, 1983–90	38
67. Death rates per 100,000 females 25–44 years of age for Human immunodeficiency virus infection, by month: United States, 1987–90	39
68. Death rates per 100,000 males 25–44 years of age for Human immunodeficiency virus infection, by month: United States, 1987–90	39
69. Death rates per 100,000 females 25–44 years of age for Symptoms, signs, and ill-defined conditions, by month: United States, 1983–90	40
70. Death rates per 100,000 males 25–44 years of age for Symptoms, signs, and ill-defined conditions, by month: United States, 1983–90	40
71. Death rates per 100,000 females 65–74 years of age for Septicemia, by month: United States, 1983–90.....	41
72. Death rates per 100,000 males 65–74 years of age for Septicemia, by month: United States, 1983–90	41

Mortality Surveillance System: Models From the Second Year

by A. Elizabeth Godfrey, M.S.; Frances M. Chevarley, Ph.D.; Harry M. Rosenberg, Ph.D.; and Kenneth D. Kochanek, M.A., Division of Vital Statistics; and Manning Feinleib, M.D., Dr.P.H., National Center for Health Statistics

Introduction

This is the second report presenting statistical charts and text from the Mortality Surveillance System (MSS). The first report presented the statistical charts and text from the first year of the MSS as published in the *Monthly Vital Statistics Report (MVSR)* volume 38, numbers 2—volume 39, number 1, and briefly described the methodology that was used (1). This report presents the statistical charts and text from the second year of the MSS as published in the MVSR volume 39, number 2—volume 40, number 1. Also presented are the monthly data used in fitting the models depicted in the published charts and the model statistics for the fitted curves.

According to the *Dictionary of Epidemiology* edited by John Last (2) surveillance is “Ongoing scrutiny, generally using methods distinguished by their practicability, uniformity, and frequently their rapidity, rather than by complete accuracy. Its main purpose is to detect changes in trend or distribution in order to initiate investigative or control measures.” Conceptually, then, the purpose of the MSS is to detect changes in trend or distribution to initiate further investigative and control measures in a practical and timely manner.

NOTES: This report was prepared in the Division of Vital Statistics. The authors gratefully acknowledge the assistance of numerous staff throughout the National Center for Health Statistics who assisted in producing the monthly Mortality Surveillance System charts and text from the second year: Statistical methodology assistance was provided by Randy Curtin and Myron Katzoff, Statistical Methods Staff, Office of Research and Methodology; programming support by Charles Royer and David Johnson, Systems and Programming Branch, Division of Vital Statistics; content review by Thomas D. Dunn, Statistical Resources Branch, Division of Vital Statistics. This report was edited by Patricia Keaton-Williams with graphics by Sarah Hinkle and typeset by Jacqueline M. Davis of the Publications Branch, Division of Data Services.

The National Center for Health Statistics (NCHS) has a data set that, because of its timeliness, can lend itself to surveillance—the provisional mortality data from the Current Mortality Sample (CMS). These data are published monthly in the MVSR about 4 months after the main month of occurrence of the deaths and continue to be one of the most accessible means of identifying and monitoring health problems. NCHS decided to use the CMS as the data source for the MSS and to apply a traditional time series regression model to the observed monthly CMS data as the methodology. This methodology had been widely and successfully used to describe trends in mortality data and for surveillance by Serfling (3), Collins (4), Choi and Thacker (5), Lui and Kendal (6), and Shumway (7). In the United States, other surveillance systems have been applied to mortality, the best known of which is the statistical system of the Centers for Disease Control and Prevention for tracking influenza and pneumonia and all causes of death by age and month (8). In Great Britain a surveillance system uses final rather than provisional mortality data (9).

The MSS was inaugurated with the February 1989 issue of the MVSR (volume 38, number 2). It consists of a series of charts and text published monthly in the MVSR depicting trends in provisional mortality data for selected causes of death and population groups. Emphasis is given to graphic presentation that permits timely identification of departures from mortality trends observed recently. Shown in the MSS charts are observed data with corresponding predicted values and 95-percent prediction intervals. Similar graphic presentation techniques have been widely used in the past (10).

Topics for the second year of the MSS were selected in consultation with other Public Health Service agencies to shed light on emerging health concerns and foresee possible changes in trend.

Topics for the second year of the Mortality Surveillance System: MVSР Issues, Volume 39, Number 2–Volume 40, Number 1

<i>Volume 39, Number 2</i>	<i>February 1990</i>	<i>Volume 39, Number 8</i>	<i>August 1990</i>
Infant mortality Neonatal mortality Postneonatal mortality Congenital anomalies Sudden infant death syndrome Respiratory distress syndrome	Infants aged under 1 year Infants aged under 28 days Infants aged 28 days–11 months Infants aged under 1 year Infants aged under 1 year Infants aged under 1 year	Diabetes mellitus Malignant neoplasms of trachea, bronchus, and lung Malignant neoplasm of breast	Females aged 45–64 years Males aged 45–64 years Females aged 65–74 years Males aged 65–74 years Females aged 65–74 years Females aged 65–74 years

<i>Volume 39, Number 7</i>	<i>July 1990</i>	<i>Volume 40, Number 1</i>	<i>January 1991</i>
Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus Malignant neoplasms of trachea, bronchus, and lung Malignant neoplasm of breast	Females aged 45–64 years Males aged 45–64 years Females aged 65–74 years Males aged 65–74 years Females aged 45–64 years Females aged 45–64 years	Human immunodeficiency virus infection Symptoms, signs, and ill-defined conditions Septicemia	Females aged 25–44 years Males aged 25–44 years Females aged 25–44 years Males aged 25–44 years Females aged 65–74 years Males aged 65–74 years

Methods

Sources of data

The MSS charts are based entirely on monthly provisional data from the CMS. The CMS is a national 10-percent systematic sample of death certificates drawn each month after the certificates are counted in the State registration offices. The sample for each of these areas consists of one-tenth of the death certificates received in the office between a given date and the corresponding date of the following month. All death certificates received during the 1-month period are sampled, regardless of the month or year in which the death occurred. As a result, the sample for a given month is not strictly comparable to a sample based on month-of-occurrence. About two-thirds of the death certificates for a given month are for deaths that actually occurred in the sample month. Because complete information concerning the underlying cause of death is sometimes not available in the State offices when the sample is drawn but is available later when copies of the final death certificates are processed, cause-of-death estimates from the CMS for certain causes are biased estimates of final data. These variations inherent in provisional data from the CMS are not corrected in the MSS. Estimates of deaths and death rates based on the CMS by age, race, sex, and cause are proportionately adjusted to be consistent with estimates based on provisional monthly U.S. totals based on counts of death certificates received in State registration offices (11,12).

Statistical model

While different types of models were analyzed to determine the type of model to use for the MSS, a time series regression model was selected because similar models had been used successfully for surveillance and because such a model is easy to use and interpret. The following time series regression model with five terms was used:

$$Y(t) = A_0 + A_1 t + A_2 t^2 + C \cos(2\pi t / 12) + S \sin(2\pi t / 12) + \epsilon_t$$

where

- $Y(t)$ = monthly death rate at time t
- t = month number ($t = 0$ for Jan. 1979)
- A_0 = coefficient, which, together with C determines the Y-intercept

A_1 = coefficient of t

A_2 = coefficient of t^2

C, S = coefficients of the harmonic terms

ϵ_t = error terms, assumed independent and normally distributed with means 0 and constant variances,

and $\cos(2\pi t / 12)$ and $\sin(2\pi t / 12)$ are 12-month period harmonic functions.

The general form of the statistical model with five terms, as shown, contains an intercept term, a trend term t , a quadratic term t^2 , a cosine term, and a sine term (the two latter terms are 12-month harmonic terms designed to capture the main characteristics of seasonal patterns of mortality). Monthly death rates for most causes of death exhibit a 12-month seasonal pattern with generally higher rates in the winter when health can be compromised by cold weather.

For the first 2 months of the second year of the MSS (volume 39, numbers 2 and 3), the coefficients of the model for the 72 charts were estimated using provisional monthly death rates from January 1979 to December 1987. The graph of the estimated equations and 95-percent prediction intervals for the monthly rates were shown through 1987 and projected beyond that. For subsequent months of the second year, the length of the period used in estimating the coefficients of the model varied from month to month because of the decision to use a projection period of exactly 12 months of provisional death rates; although the period projected remained the same length from month to month, the period modeled changed as more data became available. The symbols in each chart represent actual monthly death rates based on the CMS.

Using the model for 144 different charts in the first 2 years of the MSS has been an exploratory and learning process. By the end of the first year and for the entire second year, the principle that guided model selection was to include all five terms except in extreme cases. These cases include the following: (a) where there was no clear 12-month seasonal component in the data, the model was fitted without the harmonic terms; and (b) where the usual model yielded negative prediction intervals, the data were transformed by the natural logarithm before fitting the model. In the latter case, for graphical purposes, the data were transformed back to rates by the inverse of the natural logarithm.

Results

Summary

Of the 72 charts published during the second year of the MSS, 14 age-sex-cause groups were identified where there may have been a change in trend in the most recent period since 1987 or a greater or smaller rate of change in the recent period than shown previously: infant, neonatal, and postneonatal mortality; Sudden infant death syndrome; Respiratory distress syndrome; Cerebrovascular diseases for males aged 65–74 years and for females aged 75–84 years; Diabetes mellitus for males and females aged 45–64 and for females aged 65–74 years; Motor vehicle accidents for females aged 45–64 and 15–24 years; Homicide and legal intervention for males aged 15–24 years; and Human immunodeficiency virus (HIV) infection for females aged 25–44 years. Based on the MSS findings, a further investigation of the recent trends for these age-sex-cause groups may be warranted. For the remaining charts there was not enough evidence to suggest a change in trend.

The 72 charts and accompanying text that were published in the 12 successive MVSR issues are shown on pages 6–41. Shown in tables 1–12 are provisional monthly estimates of numbers of deaths and death rates for 1979–90 for each of the specified causes of death and selected demographic groups for the 72 charts. Estimated deaths and death rates in tables 1–12 based on 100 or fewer estimated deaths have relative standard errors of 30 percent or more and, therefore, are considered unreliable. Rates based on 100 or fewer estimated deaths are indicated by an asterisk in this table. The model parameter estimates and selected statistics for each of these 72 charts are given in table 13.

Example

The following example illustrates the type of data summarized in this report. For the first month of the second year of the MSS (volume 39, number 2) there were six charts, representing infant mortality (deaths to children under 1 year); neonatal mortality (under 28 days); postneonatal mortality (28 days to 11 months); and selected causes of infant mortality: Congenital anomalies, Sudden infant death syndrome, and Respiratory distress syndrome. The charts and text as previously published for these six charts are on pages 6–8. The center line in each of these charts denotes the predicted model based on provisional monthly death rates for the period January 1979–December 1987, and then projected for the most

recent period for these charts through December 1989. The two outside lines are the 95-percent prediction intervals; the symbols represent the observed monthly provisional death rates. As shown in these charts and as discussed in the text, monthly provisional death rates decreased for infant and neonatal mortality during the period 1979–87. For Congenital anomalies, Sudden infant death syndrome, and Respiratory distress syndrome, the trend in the monthly provisional death rates was also down during this same period. Except for 1 month in one of these charts, the observed monthly rates in the projected 24 months of 1988 and 1989 for these six charts were within the 95-percent prediction intervals of the models estimated on the basis of provisional monthly death rates for 1979–87. Also, as mentioned in the texts, infant and postneonatal mortality rates and infant mortality rates for Sudden infant death syndrome showed a seasonal pattern with provisional monthly death rates generally higher during the winter months.

In table 1 are the provisional monthly estimates of deaths and death rates for these six charts; that is, for infant mortality for the three age groups, under 1 year, under 28 days, and 28 days to 11 months, and for three selected causes of infant mortality. These monthly rates were used in producing these six published charts and their associated model statistics in table 13. As shown in table 13, the average monthly sample sizes for the first six MSS charts ranged from 32 for Respiratory distress syndrome to 339 for infant mortality. As indicated by the estimated coefficients of the model parameters and their corresponding probabilities in table 13, four of the first six MSS charts used the four-variable model and two dropped the harmonic terms. The adjusted R^2 values for these first six models for the six topics ranged from 0.2420 for Congenital anomalies to 0.8672 for infant mortality from all causes.

Discussion

As indicated in the charts and also in the statistics in table 13, the five-term model was a good general model for modeling mortality data for most age-sex-cause groups. The entire five-term model was used for 49 of the 72 charts. For 23 of the 72 charts the two harmonic terms were dropped because the monthly rates for these age-sex-cause groups did not exhibit 12-month seasonal patterns. Among these 23 charts, 17 represented specified cancers or all cancers combined; for selected demographic groups one was for Suicide for females aged 15–24 years, one was for Homicide and legal intervention for females aged 15–24 years, two for HIV infection for

males and females aged 25–44 years, one for Congenital anomalies, and one for Respiratory distress syndrome.

Although the objective was to apply the five-term model to the actual monthly death rates whenever possible, it was necessary to transform the data by the natural logarithm for 2 of the 72 charts (Septicemia for males and females aged 65–74 years) to avoid negative prediction intervals for the model. The data were transferred back by the inverse of the natural logarithm in the published charts on page 41. As indicated in table 13 the statistics for these two cases are based on a model that used data transformed by the natural logarithm.

As also shown in table 13, the adjusted R^2 statistic was generally higher for those age-sex-cause groups with larger sample sizes. The adjusted R^2 statistics were negative (indicating

a particularly poor fit of the chosen model) for six of the 72 models of the second year: for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues for males and females aged 25–44 years; for Malignant neoplasms of urinary organs for males and females aged 45–74 years; for Malignant neoplasm of prostate for males aged 65–74 years; and for Homicide and legal intervention for females 15–24 years.

Since the second year of the MSS, the MSS topics have been reevaluated and expanded. Thus, for the third year, added to the topics were age-sex-cause groups for the racial groups white and black. Although the same MSS model has been selected for the third year of the MSS, alternative models and modeling criteria merit study.

Mortality Surveillance System

Figure 1. Infant mortality rates per 100,000 live births, by month: United States, 1982-89

In 1987, the latest year for which final mortality data are available, infant mortality accounted for 38,408 deaths, yielding an infant mortality rate of 1008.2 infant deaths per 100,000 live births. Provisional infant mortality rates for infants decreased from 1979 to 1987, though at a slower pace during the latter years of this period. As shown in the chart, the observed rates for January 1988–December 1989 fell within the prediction intervals of a model estimated on the basis of provisional monthly infant mortality rates for 1979–87; however, most of the 1989 provisional rates were below the predicted line, suggesting a greater rate of decline than predicted by the model. Infant mortality rates showed a seasonal pattern of mortality with a tendency for rates to be somewhat higher during the winter.

Figure 2. Neonatal mortality rates per 100,000 live births, by month: United States, 1982-89

In 1987, the latest year for which final mortality data are available, neonatal mortality accounted for 24,627 deaths, or a rate of 646.5 neonatal deaths per 100,000 live births. Provisional mortality rates for infants under 28 days decreased from 1979 to 1987, though the latter years of this period, as shown in the chart, suggest that this trend may be continuing at a slower pace. The observed rates for January 1988–December 1989 fell within the prediction intervals of a model estimated on the basis of provisional monthly neonatal mortality rates for 1979–87; however, as with all infants, most of the 1989 provisional rates were below the predicted line, suggesting a greater rate of decline than predicted by the model.

Figure 3. Postneonatal mortality rates per 100,000 live births, by month: United States, 1982-89

According to final data for 1987, postneonatal mortality accounted for 13,781 deaths, or a rate of 361.8 postneonatal deaths per 100,000 live births. Although provisional mortality rates for infants 28 days to 11 months decreased somewhat for the period shown in the chart through 1987, evidence from recent years suggests a slowing of this trend. The observed monthly postneonatal mortality rates for January 1988-December 1989 fell within the prediction intervals of a model estimated on the basis of provisional rates for 1979-87. Mortality rates for these infants showed a seasonal pattern of mortality with a tendency for rates to be somewhat higher during the winter.

Figure 4. Infant mortality rates per 100,000 live births for Congenital anomalies, by month: United States, 1982-89

According to final data for 1987, Congenital anomalies accounted for 7,884 deaths, or 21 percent of all deaths to infants under 1 year. For the period shown in the chart through 1987, provisional mortality rates for Congenital anomalies decreased for infants under 1 year. The observed monthly infant mortality rates for this cause for January 1988-December 1989 fell within the prediction intervals of a model estimated on the basis of provisional monthly mortality rates for 1979-87; however, half of the 1989 provisional rates were below the line predicted by the model, suggesting a greater rate of decline than predicted by the model. Based on 1989 annual provisional infant mortality rates, the rate for these infants was 2.4 times the rate for Respiratory distress syndrome and almost 2 times the rate for Sudden infant death syndrome.

Figure 5. Infant mortality rates per 100,000 live births for Sudden infant death syndrome, by month: United States, 1982-89

In 1987 Sudden infant death syndrome accounted for 5,230 deaths, or 14 percent of all deaths to infants under 1 year. For the period shown in the chart through 1987, provisional infant mortality rates for Sudden infant death syndrome decreased for infants under 1 year. The observed monthly infant mortality rates for January 1988–December 1989, with the exception of 1 month, were within the prediction intervals of a model estimated on the basis of provisional monthly infant mortality rates for 1979–87; however, most of the 1989 provisional rates were below the line predicted by the model, suggesting a greater rate of decline than predicted by the model. Infant mortality rates for this cause showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter. Based on 1989 annual provisional infant mortality rates, the rate for these infants was 0.6 times the rate for Congenital anomalies and more than 1.4 times the rate for Respiratory distress syndrome.

Figure 6. Infant mortality rates per 100,000 live births for Respiratory distress syndrome, by month: United States, 1982-89

In 1987 Respiratory distress syndrome accounted for 3,283 deaths, or 9 percent of all deaths to infants under 1 year. For the period shown in the chart through 1987, provisional infant mortality rates for Respiratory distress syndrome decreased though the latter years of this period suggest that this trend may be continuing at a slower pace. The observed monthly rates for January 1988–December 1989, with the exception of 3 months, were within the prediction intervals of a model estimated on the basis of provisional monthly infant mortality rates for 1979–87; however, most of the 1989 rates were below the line predicted by the model, suggesting a greater rate of decline than predicted by the model. Based on 1989 annual provisional infant mortality rates, the rate for these infants was 0.4 times the rate for Congenital anomalies and 0.7 times the rate for Sudden infant death syndrome.

Figure 7. Death rates per 100,000 females 25-44 years of age for Diseases of heart, by month: United States, 1982-89

According to final data for 1987, Diseases of heart accounted for 4,105 deaths, or 10 percent of deaths from all causes for women aged 25-44 years. For these women this was the third most frequent cause of death after Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues (cancer) and Accidents and adverse effects. For the period shown in the chart through 1987 provisional death rates decreased for women aged 25-44 years. The observed monthly death rates for this cause for January 1988-December 1989 were consistent with a model estimated on the basis of provisional monthly death rates for 1979-87.

Figure 8. Death rates per 100,000 males 25-44 years of age for Diseases of heart, by month: United States, 1982-89

In 1987, the latest year for which final mortality data are available, Diseases of heart accounted for 11,769 deaths, or 13 percent of deaths from all causes for men aged 25-44 years. For these men Diseases of heart was the second most frequent cause of death after Accidents and adverse effects. For the period shown in the chart through 1987 provisional death rates for Diseases of heart decreased. The observed rates for January 1988-December 1989 fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for 1979-87. Death rates for these men showed a seasonal pattern of mortality with a tendency for the peak in death rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was 3 times the rate for women in this age group.

Figure 9. Death rates per 100,000 females 45-64 years of age for Diseases of heart, by month: United States, 1982-89

According to final data for 1987, Diseases of heart was the second most frequent cause of death (after cancer) for women aged 45-64 years and accounted for 36,380 deaths, or 25 percent of deaths from all causes for women in this age group. For these women provisional monthly death rates for Diseases of heart decreased from 1979 to 1987. The observed monthly death rates for January 1988-December 1989 were consistent with a model estimated on the basis of provisional monthly death rates for 1979-87. Death rates for these women showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter.

Figure 10. Death rates per 100,000 males 45-64 years of age for Diseases of heart, by month: United States, 1982-89

In 1987, the latest year for which final data are available, Diseases of heart was the most frequent cause of death for men aged 45-64 years and accounted for 86,345 deaths, or 36 percent of all deaths for men in this age group. For the period shown in the chart through 1987 provisional death rates for Diseases of heart decreased for men aged 45-64 years. Except for 1 month the observed monthly death rates for January 1988-December 1989 were within the prediction intervals of a model estimated on the basis of provisional monthly death rates for 1979-87. Death rates for these men showed a seasonal pattern of mortality with a tendency for the peak in death rates to occur during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was 2.6 times the rate for women in this same age group.

Figure 11. Death rates per 100,000 females 65-74 years of age for Diseases of heart, by month: United States, 1982-89

In 1987 Diseases of heart was the most frequent cause of death for women aged 65-74 years. It accounted for 69,425 deaths, or 34 percent of all deaths for these women. For the period shown in the chart through 1987 provisional death rates for Diseases of heart decreased for these women. The observed monthly rates for January 1988-December 1989 were within the prediction intervals of a model estimated on the basis of provisional monthly death rates for 1979-87. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality with a tendency for the peak to occur in winter. Based on 1989 provisional annual death rates, the death rate for women in this age group was 4.7 times the rate for women aged 45-64 years and almost 71 times the rate for women aged 25-44 years.

Figure 12. Death rates per 100,000 males 65-74 years of age for Diseases of heart, by month: United States, 1982-89

According to final data for 1987, Diseases of heart was the most frequent cause of death for men aged 65-74 years and accounted for 108,647 deaths, or 38 percent of deaths from all causes for men in this age group. For the period shown in the chart through 1987 provisional death rates for Diseases of heart for these men decreased. Except for 1 month the observed monthly death rates for this cause for January 1988-December 1989 were within the prediction intervals of a model estimated on the basis of provisional monthly death rates for 1979-87. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality with the tendency for rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was almost twice the rate for women in this same age group; it was 3.5 times the rate for men aged 45-64 years and 46 times the rate for men aged 25-44 years.

Figure 13. Death rates per 100,000 females 45-64 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983-90

In 1987, the latest year for which final mortality data are available, Chronic obstructive pulmonary diseases and allied conditions (COPD) accounted for 5,371 deaths, or almost 4 percent of deaths from all causes for women aged 45-64 years. For these women, COPD was the fourth leading cause of death in 1987. For the period shown in the chart through February 1989, provisional death rates for COPD increased. The observed monthly rates for the most recent 12-month period, March 1989-February 1990, with the exception of 1 month, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-February 1989. Death rates for these women showed a seasonal pattern of mortality with a tendency for rates to be higher during the late winter.

Figure 14. Death rates per 100,000 males 45-64 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983-90

According to final data for 1987, COPD accounted for 7,222 deaths, or 3 percent of deaths from all causes for men aged 45-64 years. For these men, this was the sixth leading cause of death. Provisional death rates for COPD for these men increased slightly from 1979 to the mid-1980's, and as shown in the chart, have decreased slightly since then through February 1989. The observed monthly death rates for this cause for the most recent 12-month period, March 1989-February 1990, with the exception of 1 month, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-February 1989. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be higher during the late winter. The ratio of male to female provisional annual death rates for this age group has decreased from about 2 in 1979 to about 1½ in 1989.

Figure 15. Death rates per 100,000 females 65-74 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983-90

In 1987, the latest year for which final data are available, COPD was the fourth leading cause of death for women aged 65-74 years and accounted for 10,041 deaths, or almost 5 percent of all deaths for women in this age group. For the period shown in the chart through February 1989, provisional death rates for COPD increased. The observed monthly death rates for March 1989-February 1990, the most recent 12-month period, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-February 1989. Death rates for these women showed a seasonal pattern of mortality with a tendency for rates to be higher during the late winter. Based on 1989 provisional annual death rates, the death rate for women in this age group was almost 5 times the rate for women aged 45-64 years.

Figure 16. Death rates per 100,000 males 65-74 years of age for Chronic obstructive pulmonary diseases and allied conditions, by month: United States, 1983-90

According to final data for 1987, COPD was the third leading cause of death for men aged 65-74 years. It accounted for 15,666 deaths, or 6 percent of deaths from all causes for men in this age group. For these men, provisional death rates for COPD increased slightly from 1979 to the mid-1980's, and as shown in the chart, have decreased slightly since then through February 1989. The observed monthly death rates for this cause for March 1989-February 1990, with the exception of 2 months, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-February 1989. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be higher during the late winter. The ratio of male to female provisional annual death rates for this age group has decreased from 3.5 in 1979 to 1.7 in 1989.

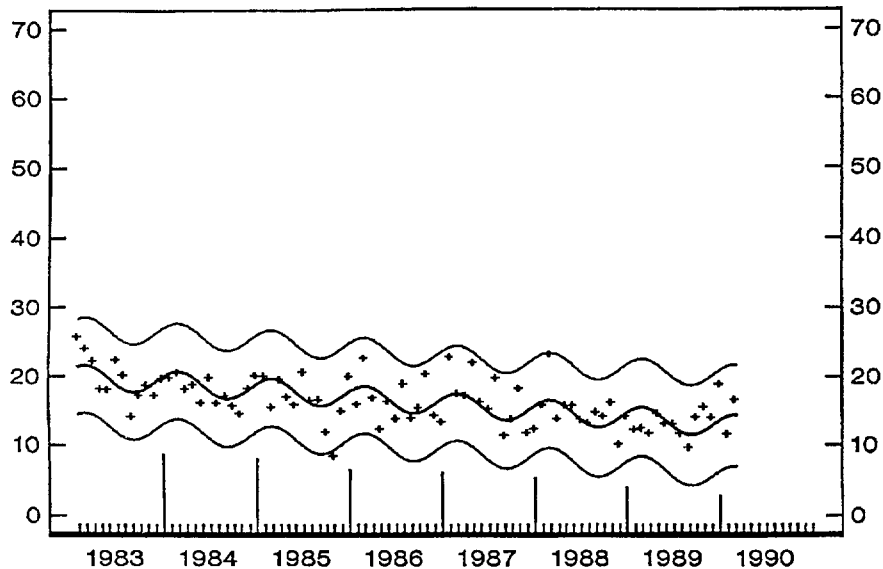

Figure 17. Death rates per 100,000 females 45-64 years of age for Chronic liver disease and cirrhosis, by month: United States, 1983-90

According to final data for 1987, Chronic liver disease and cirrhosis was the seventh leading cause of death for women aged 45-64 years and accounted for 3,596 deaths, or 2 percent of deaths from all causes for women in this age group. For the period shown in the chart through February 1989 provisional death rates for Chronic liver disease and cirrhosis decreased for these women. The observed monthly death rates for March 1989-February 1990, the most recent 12-month period, were within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-February 1989. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality with the tendency for rates to be higher during the late winter.

Figure 18. Death rates per 100,000 males 45-64 years of age for Chronic liver disease and cirrhosis, by month: United States, 1983-90

In 1987, Chronic liver disease and cirrhosis was the fifth leading cause of death for men aged 45-64 years. It accounted for 8,100 deaths, or 3 percent of all deaths for men in this age group. For the period shown in the chart through February 1989, provisional death rates for Chronic liver disease and cirrhosis decreased for these men. The observed monthly rates for March 1989-February 1990 were within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-February 1989. Based on 1989 provisional annual death rates for Chronic liver disease and cirrhosis, the death rate for men in this age group was about 2½ times the rate for women in the same age group.

Figure 19. Death rates per 100,000 females 45-64 years of age for Cerebrovascular diseases, by month: United States, 1983-90

In 1987, the latest year for which final mortality data are available, Cerebrovascular diseases accounted for 7,516 deaths, or 5 percent of deaths from all causes for women aged 45-64 years. For these women, Cerebrovascular diseases was the third leading cause of death in 1987. For the period shown in the chart through March 1989, provisional death rates for Cerebrovascular diseases decreased. The observed monthly rates for the most recent 12-month period, April 1989-March 1990, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Death rates for these women showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter.

Figure 20. Death rates per 100,000 males 45-64 years of age for Cerebrovascular diseases, by month: United States, 1983-90

According to final data for 1987, Cerebrovascular diseases accounted for 8,644 deaths, or almost 4 percent of deaths from all causes for men aged 45-64 years. For these men, this was the fourth leading cause of death. For the period shown in the chart through March 1989, provisional death rates for Cerebrovascular diseases for these men decreased. The observed monthly death rates for this cause for the most recent 12-month period, April 1989-March 1990, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was 1.3 times the rate for women in this same age group.

Figure 21. Death rates per 100,000 females 65-74 years of age for Cerebrovascular diseases, by month: United States, 1983-90

In 1987, the latest year for which final data are available, Cerebrovascular diseases was the third leading cause of death for women aged 65-74 years and accounted for 13,836 deaths, or almost 7 percent of all deaths for women in this age group. For the period shown in the chart through March 1989, provisional death rates for Cerebrovascular diseases decreased. The observed monthly death rates for the most recent 12-month period, April 1989-March 1990, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Death rates for these women showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for women in this age group was more than four times the rate for women aged 45-64 years.

Figure 22. Death rates per 100,000 males 65-74 years of age for Cerebrovascular diseases, by month: United States, 1983-90

According to final data for 1987, Cerebrovascular diseases was the fourth leading cause of death for men aged 65-74 years. It accounted for 13,931 deaths, or almost 5 percent of deaths from all causes for men in this age group. For the period shown in the chart through March 1989, provisional death rates for these men decreased. The observed monthly death rates for this cause for April 1989-March 1990, the most recent 12-month period, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. However, most of the 1989 and 1990 provisional rates were above the predicted line, suggesting a smaller rate of decline than predicted by the model. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was 1.3 times the rate for women in this age group.

Figure 23. Death rates per 100,000 females 75-84 years of age for Cerebrovascular diseases, by month: United States, 1983-90

According to final data for 1987, Cerebrovascular diseases was the third leading cause of death for women aged 75-84 years and accounted for 30,978 deaths, or about 10 percent of deaths from all causes for women in this age group. For the period shown in the chart through March 1989 provisional death rates for Cerebrovascular diseases decreased for these women. The observed monthly death rates for April 1989-March 1990, the most recent 12-month period, were within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. However, most of the 1989 and 1990 provisional rates were at or above the predicted line, suggesting a slowing of the downward trend. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality with the tendency for rates to be higher during the winter.

Figure 24. Death rates per 100,000 males 75-84 years of age for Cerebrovascular diseases, by month: United States, 1983-90

In 1987, Cerebrovascular diseases was the third leading cause of death for men aged 75-84 years. It accounted for 21,352 deaths, or more than 7 percent of all deaths for men in this age group. For the period shown in the chart through March 1989, provisional death rates for Cerebrovascular diseases decreased for these men. The observed monthly rates for April 1989-March 1990, the most recent 12-month period, were within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Based on 1989 provisional annual death rates for Cerebrovascular diseases, the death rate for men in this age group was slightly higher than the rate for women in the same age group.

Figure 25. Death rates per 100,000 females 25-44 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983-90

In 1987, the latest year for which final mortality data are available, cancer accounted for 11,074 deaths, or almost 28 percent of deaths from all causes for women aged 25-44 years. For these women cancer was the leading cause of death in 1987. For the period shown in the chart through March 1989, there has been no discernible upward or downward trend in provisional death rates for this age-sex group. The observed monthly death rates for the most recent 12-month period, April 1989-March 1990 (with the exception of 2 months), fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989.

Figure 26. Death rates per 100,000 males 25-44 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983-90

According to final data for 1987, cancer accounted for 9,231 deaths, or about 10 percent of deaths from all causes for men aged 25-44 years. For these men this was the fourth leading cause of death. For the period shown in the chart through March 1989, there has been no discernible upward or downward trend in provisional death rates for this age-sex group. The observed monthly death rates for this cause for April 1989-March 1990, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Based on 1989 provisional annual death rates, the death rate for men in this age group was 0.8 times the rate for women in this same age group.

Figure 27. Death rates per 100,000 females 45-64 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983-90

In 1987, the latest year for which final data are available, cancer was the leading cause of death for women aged 45-64 years and accounted for 62,762 deaths, or 42 percent of all deaths for women in this age group. For these women provisional death rates for cancer increased from 1979 to the mid-1980's and, as shown in the chart, have decreased since then through March 1989. The observed monthly death rates for the most recent 12-month period, April 1989-March 1990, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Death rates for these women showed a seasonal pattern of mortality with a tendency for rates to be somewhat higher during the winter. Based on 1989 provisional annual death rates, the cancer death rate for women in this age group was almost 9 times the rate for women aged 25-44 years.

Figure 28. Death rates per 100,000 males 45-64 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983-90

According to final data for 1987, cancer was the second leading cause of death for men aged 45-64 years. It accounted for 73,902 deaths, or almost 31 percent of deaths from all causes for men in this age group. For these men provisional death rates for cancer increased from 1979 to the early 1980's and, as shown in the chart, have decreased since then through March 1989. The observed monthly death rates for this cause for April 1989-March 1990, the most recent 12-month period, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be somewhat higher during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was 1.3 times the rate for women in this age group and 13 times the rate for men aged 25-44 years.

Figure 29. Death rates per 100,000 females 65-74 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983-90

According to final data for 1987, cancer was the second leading cause of death for women aged 65-74 years and accounted for 64,231 deaths, or 32 percent of deaths from all causes for women in this age group. For the period shown in the chart through March 1989, provisional death rates for cancer increased for these women. The observed monthly death rates for April 1989-March 1990, with the exception of 1 month, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality with the tendency for rates to be somewhat higher during the winter. Based on 1989 provisional annual death rates, the death rate for women in this age group was 2½ times the rate for women aged 45-64 years.

Figure 30. Death rates per 100,000 males 65-74 years of age for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, by month: United States, 1983-90

In 1987, cancer was the second leading cause of death for men aged 65-74 years. It accounted for 84,815 deaths, or 30 percent of all deaths for men in this age group. For these men provisional death rates for cancer increased from 1979 to the early 1980's and, as shown in the chart, have decreased since then through March 1989. The observed monthly death rates for April 1989-March 1990, with the exception of 1 month, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality with the tendency for rates to be somewhat higher during the winter. Based on 1989 provisional annual death rates for cancer, the death rate for men in this age group was about 1½ times the rate for women in the same age group and about 3 times the rate for men aged 45-64 years.

Figure 31. Death rates per 100,000 females 45-64 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983-90

In 1987, the latest year for which final mortality data are available, Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus (colo-rectal cancer) accounted for 5,680 deaths, or 4 percent of deaths from all causes for women aged 45-64 years. Provisional death rates for this age-sex group increased from 1979 to the early 1980's and, as shown in the chart, have decreased since then through March 1989. The observed monthly death rates for the most recent 12-month period, April 1989-March 1990, (with the exception of 1 month) fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989.

Figure 32. Death rates per 100,000 males 45-64 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983-90

According to final data for 1987, colo-rectal cancer accounted for 7,098 deaths, or 3 percent of deaths from all causes for men aged 45-64 years. Provisional death rates for this age-sex group increased from 1979 to the mid-1980's and, as shown in the chart, have decreased since then through March 1989. The observed monthly death rates for this cause for April 1989-March 1990 fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Based on 1989 provisional annual death rates, the death rate for men in this age group was 1.5 times the rate for women in this same age group.

Figure 33. Death rates per 100,000 females 65-74 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983-90

In 1987, the latest year for which final data are available, colo-rectal cancer accounted for 7,659 deaths, or almost 4 percent of all deaths for women aged 65-74 years. For the period shown in the chart through March 1989, provisional death rates for colo-rectal cancer decreased for these women. The observed monthly death rates for the most recent 12-month period, April 1989-March 1990, (with the exception of 2 months) fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Based on 1989 provisional annual death rates, the death rate for women in this age group was 3.7 times the rate for women aged 45-64 years.

Figure 34. Death rates per 100,000 males 65-74 years of age for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus, by month: United States, 1983-90

According to final data for 1987, colo-rectal cancer accounted for 9,129 deaths, or 3 percent of deaths from all causes for men aged 65-74 years. For these men provisional death rates for this cause increased from 1979 to the mid-1980's and, as shown in the chart, have decreased since then through March 1989. The observed monthly death rates for this cause for April 1989-March 1990, the most recent 12-month period, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. Based on 1989 provisional annual death rates, the death rate for men in this age group was 1.5 times the rate for women in this age group and 3.8 times the rate for men aged 45-64 years.

Figure 35. Death rates per 100,000 females 45-64 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States, 1983-90

In 1987, Malignant neoplasms of trachea, bronchus, and lung (lung cancer) was a major cause of cancer mortality and accounted for 15,209 deaths, or 24 percent of all cancer deaths for women aged 45-64 years. For the period shown in the chart through March 1989, provisional death rates for lung cancer increased for these women. The observed monthly death rates for April 1989-March 1990 fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality with the tendency for rates to be higher during the winter.

Figure 36. Death rates per 100,000 females 45-64 years of age for Malignant neoplasm of breast, by month: United States, 1983-90

According to final data for 1987, Malignant neoplasm of breast (breast cancer) was also a major cause of cancer mortality and accounted for 14,844 deaths, also 24 percent of all cancer mortality for women aged 45-64 years. For these women provisional death rates for breast cancer increased slightly from 1979 to the mid-1980's and, as shown in the chart, have decreased slightly since then through March 1989; the provisional annual death rate for 1989 was slightly higher than the rate for 1979. The observed monthly death rates for April 1989-March 1990 (with the exception of 2 months) fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-March 1989.

Figure 37. Death rates per 100,000 females 45-64 years of age for Diabetes mellitus, by month: United States, 1983-90

In 1987, the latest year for which final mortality data are available, Diabetes mellitus was the sixth leading cause of death for women aged 45-64 years and accounted for 4,019 deaths, or about 3 percent of deaths from all causes for these women. For the period shown in the chart through May 1989, there has been no discernible trend in provisional death rates for these women. For the most recent 12-month period, June 1989-May 1990, all but two of the observed monthly rates fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. However, of these 12 rates, 10 were above the prediction line, including 2 above the 95-percent prediction band. Although this may suggest that the trend is increasing, there is no known reason for this change in trend (13). These monthly death rates showed a seasonal pattern of mortality, with higher rates during the winter.

Figure 38. Death rates per 100,000 males 45-64 years of age for Diabetes mellitus, by month: United States, 1983-90

According to final data for 1987, Diabetes mellitus was the eighth leading cause of death for men aged 45-64 years and accounted for 4,153 deaths, or about 2 percent of deaths from all causes for these men. For the period shown in the chart through May 1989, provisional death rates increased slightly for these men. For the most recent 12-month period shown in the chart, all but one of the observed monthly rates fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. However, of these 12 rates, 10 were above the prediction line and 1 was above the 95-percent prediction band. Although this may suggest a larger increase than that shown in the past, there is no known reason for this trend (13). These monthly death rates showed a seasonal pattern of mortality, with higher rates during the winter.

Figure 39. Death rates per 100,000 females 65-74 years of age for Diabetes mellitus, by month: United States, 1983-90

In 1987, the latest year for which final data are available, Diabetes mellitus was the fifth leading cause of death and accounted for 5,877 deaths, or about 3 percent of all deaths for women aged 65-74 years. For the period shown in the chart through May 1989, there has been no discernible upward or downward trend in the provisional death rates for Diabetes mellitus for these women. Most of the observed monthly rates for the latest 12-month period, from June 1989-May 1990, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. However, of these 12 rates, 9 were above the prediction line, including 2 above the 95-percent prediction band. Although this may suggest that the trend is increasing, there is no known reason for this change in trend (13). The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality, with a tendency toward higher rates during the winter. Based on provisional annual death rates for 1989, the death rate for women in this age group was 3.5 times the rate for women aged 45-64 years.

Figure 40. Death rates per 100,000 males 65-74 years of age for Diabetes mellitus, by month: United States, 1983-90

According to final data for 1987, Diabetes mellitus was the seventh leading cause of death for men aged 65-74 years and accounted for 4,912 deaths, or about 2 percent of deaths from all causes for these men. For this group provisional death rates have increased slightly since the mid-1980's through May 1989. The observed monthly rates for June 1989-May 1990, with the exception of 3 months, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for June 1979-May 1989. The monthly death rates for this cause and age-sex group showed a seasonal pattern of mortality, with a tendency toward higher rates during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was about the same as the rate for women in this age group and 3.1 times the rate for men aged 45-64 years.

Figure 41. Death rates per 100,000 females 65-74 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States, 1983-90

In 1987, Malignant neoplasms of trachea, bronchus, and lung (lung cancer) was a major cause of cancer mortality and accounted for 15,137 deaths, or 24 percent of all cancer mortality for women aged 65-74 years. For the period shown in the chart through May 1989, provisional death rates for lung cancer increased for these women. The observed monthly rates for June 1989-May 1990, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989.

Figure 42. Death rates per 100,000 females 65-74 years of age for Malignant neoplasm of breast, by month: United States, 1983-90

According to final data for 1987, Malignant neoplasm of breast (breast cancer) was also a major cause of cancer mortality and accounted for 10,664 deaths, or 17 percent of all cancer mortality, for women aged 65-74 years. For the period shown in the chart through May 1989 provisional death rates for breast cancer increased slightly for these women. The observed monthly death rates for June 1989-May 1990, except for 2 months, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989.

Figure 43. Death rates per 100,000 females 45-74 years of age for Malignant neoplasms of urinary organs, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Malignant neoplasms of urinary organs (cancer of the urinary organs) was the fifth most frequent cause of cancer mortality for women aged 45-74 years and accounted for 3,307 deaths, or about 1 percent of deaths from all causes and 3 percent of deaths from all cancers for these women. For the period shown in the chart through May 1989, there was no discernible upward or downward trend in provisional death rates for these women. For the most recent 12-month period, June 1989-May 1990, the observed monthly death rates were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989.

Figure 44. Death rates per 100,000 males 45-74 years of age for Malignant neoplasms of urinary organs, by month: United States, 1983-90

According to final data for 1988, cancer of the urinary organs was the fourth most frequent cause of cancer mortality for men aged 45-74 years and accounted for 7,002 deaths, or about 1 percent of deaths from all causes and 4 percent of deaths from all cancers for these men. For the period shown in the chart through May 1989, there was no discernible upward or downward trend in the provisional death rates for these men. For the most recent 12-month period, June 1989-May 1990, the observed monthly death rates, except for 1 month, were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Based on 1989 provisional annual death rates, the death rate for men was 2.3 times the rate for women in this same age group.

Figure 45. Death rates per 100,000 males 45-64 years of age for Malignant neoplasm of prostate, by month: United States, 1983-90

In 1988, the latest year for which final data are available, Malignant neoplasm of prostate (prostate cancer) accounted for 2,838 deaths, or about 1 percent of all deaths and about 4 percent of all cancer deaths for men aged 45-64 years. For the period shown in the chart through May 1989, provisional death rates for prostate cancer increased slightly for these men. For the most recent 12-month period, June 1989-May 1990, the observed monthly death rates fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989.

Figure 46. Death rates per 100,000 males 65-74 years of age for Malignant neoplasm of prostate, by month: United States, 1983-90

According to final data for 1988, for men aged 65-74 years, prostate cancer accounted for 8,812 deaths, or about 3 percent of deaths from all causes and 10 percent of all cancer deaths for these men. For the period shown in the chart through May 1989, provisional death rates have increased slightly for men aged 65-74 years, similar to the slight increase in rates for men aged 45-64 years. For the most recent 12-month period, June 1989-May 1990, the monthly rates fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Based on 1989 provisional annual death rates, the death rate for men in this age group was 7.3 times the rate for men aged 45-64 years.

Figure 47. Death rates per 100,000 females 45-64 years of age for Malignant neoplasm of ovary, by month: United States, 1983-90

In 1988, Malignant neoplasm of ovary (ovarian cancer) accounted for 3,895 deaths, or 3 percent of all deaths and 6 percent of all cancer mortality for women aged 45-64 years. For the period shown in the chart through May 1989, provisional death rates for ovarian cancer decreased slightly for these women. The observed monthly rates for June 1989-May 1990, fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989.

Figure 48. Death rates per 100,000 females 65-74 years of age for Malignant neoplasm of ovary, by month: United States, 1983-90

According to final data for 1988, ovarian cancer accounted for 3,853 deaths, or 2 percent of all deaths and 6 percent of all cancer mortality, for women aged 65-74 years. For the period shown in the chart through May 1989, provisional death rates for ovarian cancer increased slightly for these women, in contrast to the slight decrease in rates for women aged 45-64 years. The observed monthly death rates for June 1989-May 1990 fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Based on 1989 provisional annual death rates, the death rate for women in this age group was 2.6 times the rate for women aged 45-64 years. This ratio was 1.9 in 1979.

Figure 49. Death rates per 100,000 females 25-64 years of age for Pneumonia and influenza, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Pneumonia and influenza was the 10th leading cause of death for women aged 25-64 years and accounted for 2,915 deaths, or about 2 percent of deaths from all causes for these women. For the period shown in the chart through May 1989, there was no discernible upward or downward trend in provisional death rates for these women. For the most recent 12-month period, June 1989-May 1990, the observed monthly rates were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Death rates for these women showed a seasonal pattern of mortality, with a tendency for rates to be higher during the winter.

Figure 50. Death rates per 100,000 males 25-64 years of age for Pneumonia and influenza, by month: United States, 1983-90

According to final data for 1988, Pneumonia and influenza was the 11th leading cause of death for men aged 25-64 years and accounted for 5,173 deaths, or about 2 percent of deaths from all causes for these men. For the period shown in the chart through May 1989, there was no discernible upward or downward trend in the provisional death rates for these men. For the most recent 12-month period, June 1989-May 1990, the observed monthly rates were consistent with a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Death rates for these men showed a seasonal pattern of mortality, with a tendency for rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for men was 1.6 times the rate for women in this same age group.

Figure 51. Death rates per 100,000 females 65-74 years of age for Pneumonia and influenza, by month: United States, 1983-90

In 1988, the latest year for which final data are available, Pneumonia and influenza was the sixth leading cause of death and accounted for 4,163 deaths, or about 2 percent of all deaths for women aged 65-74 years. For the period shown in the chart through May 1989, provisional death rates for Pneumonia and influenza increased for these women. For the most recent 12-month period, June 1989-May 1990, the observed monthly rates, except 1 month, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Death rates for these women showed a seasonal pattern of mortality, with a tendency for rates to be higher during the winter.

Figure 52. Death rates per 100,000 males 65-74 years of age for Pneumonia and influenza, by month: United States, 1983-90

According to final data for 1988, for men aged 65-74 years, Pneumonia and influenza was the fifth leading cause of death and accounted for 6,550 deaths, or about 2 percent of deaths from all causes. For the period shown in the chart through May 1989, provisional death rates increased for men aged 65-74 years. For the most recent 12-month period, June 1989-May 1990, the observed monthly rates were consistent with a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Death rates for these men showed a seasonal pattern of mortality, with a tendency for rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was twice the rate for women in this same age group.

Figure 53. Death rates per 100,000 males 45-54 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States, 1983-90

In 1988, Malignant neoplasms of trachea, bronchus, and lung (lung cancer) was a major cause of cancer mortality and accounted for 7,337 deaths, or 10 percent of all deaths and 38 percent of all cancer mortality for men aged 45-54 years. For the period shown in the chart through May 1989, provisional death rates for lung cancer decreased for these men. The observed monthly rates for June 1989-May 1990 fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989.

Figure 54. Death rates per 100,000 males 55-64 years of age for Malignant neoplasms of trachea, bronchus, and lung, by month: United States, 1983-90

According to final data for 1988, lung cancer was a major cause of cancer mortality and accounted for 22,603 deaths, or 14 percent of all deaths and 42 percent of all cancer mortality, for men aged 55-64 years. In contrast to the decrease in provisional death rates for men in the younger age group, provisional death rates for lung cancer increased from 1979 to the mid-1980's and, as shown in the chart, have leveled off since then through May 1989. The observed monthly death rates for June 1989-May 1990 fell within the prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-May 1989. Based on 1989 provisional annual death rates, the death rate for men in this age group was 3.4 times the rate for men aged 45-54 years.

Figure 55. Death rates per 100,000 females under 15 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects was the third leading cause of death for females under age 15 and accounted for 2,959 deaths, or 13 percent of all deaths for this age-sex group. Motor vehicle accidents accounted for 1,444 deaths, or 6 percent of deaths from all causes and 49 percent of all accidental deaths. Provisional death rates for Motor vehicle accidents decreased from 1979 to the mid-1980's and, as shown in the chart, have increased slightly since then through July 1989. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates, except for 1 month, were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher during the summer.

Figure 56. Death rates per 100,000 males under 15 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects was the third leading cause of death for males under age 15 and accounted for 5,050 deaths, or 16 percent of all deaths for this age-sex group. Motor vehicle accidents accounted for 2,199 deaths, or about 7 percent of deaths from all causes and 44 percent of all accidental deaths. Provisional death rates for Motor vehicle accidents decreased from 1979 to the mid-1980's and, as shown in the chart, have leveled off since then through July 1989. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates were consistent with a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher during the summer. Based on 1989 provisional annual death rates, the death rate for males in this age group was 1.5 times the rate for females in this same age group.

Figure 57. Death rates per 100,000 females 25-44 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects was the second leading cause of death for women aged 25-44 years and accounted for 6,306 deaths, or 15 percent of all deaths for these women. Motor vehicle accidents accounted for 4,184 deaths, or about 10 percent of deaths from all causes and 66 percent of all accidental deaths. Provisional death rates for Motor vehicle accidents decreased from 1979 to the mid-1980's and, as shown in the chart, have increased since then through July 1989. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates were consistent with a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher from late summer to early fall.

Figure 58. Death rates per 100,000 males 25-44 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects was the leading cause of death for men aged 25-44 years and accounted for 21,973 deaths, or 23 percent of all deaths for these men. Motor vehicle accidents accounted for 12,396 deaths, or 13 percent of deaths from all causes and 56 percent of all accidental deaths. Provisional death rates for Motor vehicle accidents decreased from 1979 to the mid-1980's and, as shown in the chart, have leveled off since then through July 1989. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates were, except for 1 month, within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher in the summer. Based on 1989 provisional annual death rates, the death rate for men in this age group was 2.8 times the rate for women in this same age group, although this male to female ratio has been decreasing since 1979 (3.7).

Figure 59. Death rates per 100,000 females 45-64 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects for women aged 45-64 years accounted for 4,384 deaths, or 3 percent of all deaths. Motor vehicle accidents accounted for 2,388 deaths, or 2 percent of deaths from all causes and 54 percent of all accidental deaths. Provisional death rates for Motor vehicle accidents decreased from 1979 to the early 1980's and, as shown in the chart, have increased since then through July 1989. The observed monthly rates for August 1989-July 1990, except for 1 month, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989; however, 11 of these 12 rates were below the predicted line, suggesting a change in trend. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher during the early fall. Based on 1989 provisional annual death rates, the death rate for women in this age group was about twice that for females under age 15 years.

Figure 60. Death rates per 100,000 males 45-64 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects for men aged 45-64 years accounted for 10,793 deaths, or 5 percent of all deaths. Motor vehicle accidents accounted for 4,857 deaths, or 2 percent of deaths from all causes and 45 percent of all accidental deaths. Provisional death rates for Motor vehicle accidents decreased from 1979 to the mid-1980's and, as shown in the chart, have leveled off since then through July 1989. The observed rates for August 1989-July 1990 were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher during the late fall. Based on 1989 provisional annual death rates, the death rate for these men was 2.4 times the rate for women in this same age group, 0.8 times the rate for men aged 25-44 years, and almost 3 times the rate for males under age 15 years.

Figure 61. Death rates per 100,000 females 15-24 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects was the leading cause of death for females aged 15-24 years and accounted for 45 percent of all deaths for this age-sex group. Motor vehicle accidents accounted for 3,717 deaths, or 86 percent of all accidental deaths and 39 percent of deaths from all causes for these females. Provisional death rates for Motor vehicle accidents decreased slightly from 1979 to the mid-1980's and, as shown in the chart, have increased since then through July 1989. For the most recent 12-month period the observed monthly rates, except for 2 months, were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. However, 11 of the 12 rates were below the predicted line, suggesting a change in trend. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher during the summer.

Figure 62. Death rates per 100,000 males 15-24 years of age for Motor vehicle accidents, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Accidents and adverse effects was the leading cause of death for males aged 15-24 years and accounted for one-half of all deaths for this age-sex group. Motor vehicle accidents accounted for 10,689 deaths, or 75 percent of all accidental deaths and 37 percent of deaths from all causes for these males. Provisional death rates for Motor vehicle accidents decreased from 1979 to the mid-1980's and, as shown in the chart, have increased slightly since then through July 1989. For the most recent 12-month period the observed monthly rates, with the exception of 1 month, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. Death rates showed a seasonal pattern of mortality with a tendency for rates to be higher during the summer.

Figure 63. Death rates per 100,000 females 15-24 years of age for Homicide and legal intervention, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Homicide and legal intervention was the second leading cause of death for women aged 15-24 years and accounted for 1,103 deaths, or 11 percent of all deaths for these women. For this age-sex group, there has been no discernible upward or downward trend in the provisional death rates for Homicide and legal intervention for the period shown in the chart through July 1989. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates were consistent with a model estimated on the basis of provisional monthly death rates for January 1979-July 1989.

Figure 64. Death rates per 100,000 males 15-24 years of age for Homicide and legal intervention, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Homicide and legal intervention was the second leading cause of death for men aged 15-24 years and accounted for 4,668 deaths, or 16 percent of all deaths for these men. For this age-sex group, provisional death rates for Homicide and legal intervention decreased slightly from 1979 to the mid-1980's and, as shown in the chart, have increased since then through July 1989. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates, except for 3 months, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. However, all but 2 of the 12 rates were above the 95-percent prediction line, suggesting that the increasing trend may be larger than that predicted by the model. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be higher during the summer. Based on 1989 provisional annual death rates, the death rate for men in this age group was 4.6 times the rate for women in this same age group.

Figure 65. Death rates per 100,000 females 15-24 years of age for Suicide, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Suicide was the third leading cause of death for women aged 15-24 years and accounted for 786 deaths or 8 percent of deaths from all causes for these women. For this age-sex group, there has been no discernible upward or downward trend in the provisional death rates for Suicide during the period shown in the chart. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates, except for 1 month, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989.

Figure 66. Death rates per 100,000 males 15-24 years of age for Suicide, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Suicide was the third leading cause of death for men aged 15-24 years and accounted for 4,143 deaths or 15 percent of all deaths for these men. For the period shown in the chart through July 1989, provisional death rates for Suicide have increased slightly for these men. For the most recent 12-month period, August 1989-July 1990, the observed monthly rates, except for 1 month, were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-July 1989. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be higher during the late winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was 4.5 times the rate for women in this same age group.

Figure 67. Death rates per 100,000 females 25–44 years of age for Human immunodeficiency virus infection, by month: United States, 1987–90

[Model fitted using data from January 1987–September 1989. Beginning with data for 1987, a new classification for Human immunodeficiency virus infection was introduced in the United States.]

In 1988, the latest year for which final mortality data are available, HIV infection was the eighth leading cause of death for women aged 25–44 years and accounted for 1,285 deaths, or 3 percent of all deaths for this age-sex group. For January 1987–September 1989 provisional death rates for HIV infection increased for these women. For the most recent 12-month period, October 1989–September 1990, the observed monthly rates were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1987–September 1989. However, 10 of these 12 rates were above the predicted line, suggesting a possible change in the trend predicted by provisional monthly death rates for January 1987–September 1989.

Figure 68. Death rates per 100,000 males 25–44 years of age for Human immunodeficiency virus infection, by month: United States, 1987–90

[Model fitted using data from January 1987–September 1989. Beginning with data for 1987, a new classification for Human immunodeficiency virus infection was introduced in the United States.]

In 1988, the latest year for which final mortality data are available, HIV infection was the third leading cause of death for men aged 25–44 years and accounted for 10,935 deaths, or 11 percent of all deaths for this age-sex group. For January 1987–September 1989 the provisional death rates for HIV infection have increased for these men. For the most recent 12-month period, October 1989–September 1990, the observed monthly rates, except for 1 month, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1987–September 1989. Based on 1989 provisional annual death rates, the death rate for men in this age group was 8.5 times the rate for women in this same age group.

Figure 69. Death rates per 100,000 females 25-44 years of age for Symptoms, signs, and ill-defined conditions, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Symptoms, signs, and ill-defined conditions accounted for 1,320 deaths, or 3 percent of all deaths for women aged 25-44 years. For this age-sex group provisional death rates decreased slightly from 1979 to the mid-1980's and, as shown in the chart, have increased since then through September 1989. For the most recent 12-month period, October 1989-September 1990, the observed monthly rates were consistent with a model estimated on the basis of provisional monthly death rates for January 1979-September 1989.

Figure 70. Death rates per 100,000 males 25-44 years of age for Symptoms, signs, and ill-defined conditions, by month: United States, 1983-90

In 1988, the latest year for which final mortality data are available, Symptoms, signs, and ill-defined conditions accounted for 2,995 deaths, or 3 percent of all deaths for men aged 25-44 years. For this age-sex group, provisional death rates for Symptoms, signs, and ill-defined conditions were stable from 1979 to the mid-1980's and, as shown in the chart, have increased since then through September 1989. For the most recent 12-month period, October 1989-September 1990, the observed monthly rates, except for 3 months, fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979-September 1989. Based on 1989 provisional annual death rates, the death rate for men in this age group was 2.6 times the rate for women in this same age group.

In 1988, the latest year for which final mortality data are available, Septicemia was the 10th leading cause of death for women aged 65–74 years and accounted for 2,018 deaths or 1 percent of deaths from all causes for these women. For this age-sex group, provisional death rates increased slightly from 1979 to the late 1980's and, as shown in the chart have leveled off since then through September 1989. For the most recent 12-month period, October 1989–September 1990, the observed monthly rates fell within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979–September 1989. Death rates for these women showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter.

Figure 71. Death rates per 100,000 females 65–74 years of age for Septicemia, by month: United States, 1983-90

[Data transformed by the natural logarithm before fitting model.]

Figure 72. Death rates per 100,000 males 65–74 years of age for Septicemia, by month: United States, 1983-90

[Data transformed by the natural logarithm before fitting model.]

In 1988, the latest year for which final mortality data are available, Septicemia was the 11th leading cause of death for men aged 65–74 years and accounted for 2,264 deaths or 1 percent of all deaths for these men. For this age-sex group provisional death rates increased slightly from 1979 to the late 1980's and, as shown in the chart, have leveled off since then through September 1989. For the most recent 12-month period, October 1989–September 1990, the observed monthly rates, except for 1 month, were within the 95-percent prediction intervals of a model estimated on the basis of provisional monthly death rates for January 1979–September 1989. Death rates for these men showed a seasonal pattern of mortality with a tendency for rates to be higher during the winter. Based on 1989 provisional annual death rates, the death rate for men in this age group was 1.6 times the rate for women in this same age group.

NOTES: Data in this table are for figures 25–30. These figures were published in the *Monthly Vital Statistics Report* on births, marriages, divorces, and deaths for June 1990, volume 39, number 6.

Table 6. Estimated number of deaths and death rates for Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus; Malignant neoplasm of breast; and Malignant neoplasms of trachea, bronchus, and lung; by specified age, sex, year, and month of occurrence: United States, January 1979–December 1990

[Data are provisional, estimated from a 10-percent sample of deaths. Rates on an annual basis per 100,000 estimated population for the specific month]

Year and month of occurrence	<i>Malignant neoplasms of colon, rectum, rectosigmoid junction, and anus</i>								<i>Malignant neoplasm of breast, female</i>		<i>Malignant neoplasms of trachea, bronchus, and lung, female</i>	
	45–64 years				65–74 years				45–64 years		45–64 years

NOTES: Data in this table are for figures 67–72. These figures were published in the *Monthly Vital Statistics Report* on births, marriages, divorces, and deaths for January 1991, volume 40, number 1.

Table 13. Selected statistics and model parameters for the second year's topics from the Mortality Surveillance System, *Monthly Vital Statistics Report*, volume 39, number 2—volume 40, number 1: United States, January 1979—December 1989

[Rates on an annual basis per 100,000 estimated population in specified group. Sample size is based on the sum of the sample sizes for all of the months for each of the years 1979–90 divided by 144; for HIV infection, sample size is based on the sum of the sample sizes for all of the months for each of the years 1987–90 divided by 48]

Vital and Health Statistics series descriptions

- SERIES 1. Programs and Collection Procedures**—These reports describe the data collection programs of the National Center for Health Statistics. They include descriptions of the methods used to collect and process the data, definitions, and other material necessary for understanding the data.
- SERIES 2. Data Evaluation and Methods Research**—These reports are studies of new statistical methods and include analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory. These studies also include experimental tests of new survey methods and comparisons of U.S. methodology with those of other countries.
- SERIES 3. Analytical and Epidemiological Studies**—These reports present analytical or interpretive studies based on vital and health statistics. These reports carry the analyses further than the expository types of reports in the other series.
- SERIES 4. Documents and Committee Reports**—These are final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
- SERIES 5. International Vital and Health Statistics Reports**—These reports are analytical or descriptive reports that compare U.S. vital and health statistics with those of other countries or present other international data of relevance to the health statistics system of the United States.
- SERIES 6. Cognition and Survey Measurement**—These reports are from the National Laboratory for Collaborative Research in Cognition and Survey Measurement. They use methods of cognitive science to design, evaluate, and test survey instruments.
- SERIES 10. Data From the National Health Interview Survey**—These reports contain statistics on illness; unintentional injuries; disability; use of hospital, medical, and other health services; and a wide range of special current health topics covering many aspects of health behaviors, health status, and health care utilization. They are based on data collected in a continuing national household interview survey.
- SERIES 11. Data From the National Health Examination Survey, the National Health and Nutrition Examination Surveys, and the Hispanic Health and Nutrition Examination Survey**—Data from direct examination, testing, and measurement on representative samples of the civilian noninstitutionalized population provide the basis for (1) medically defined total prevalence of specific diseases or conditions in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics, and (2) analyses of trends and relationships among various measurements and between survey periods.
- SERIES 12. Data From the Institutionalized Population Surveys**—Discontinued in 1975. Reports from these surveys are included in Series 13.
- SERIES 13. Data From the National Health Care Survey**—These reports contain statistics on health resources and the public's use of health care resources including ambulatory, hospital, and long-term care services based on data collected directly from health care providers and provider records.
- SERIES 14. Data on Health Resources: Manpower and Facilities**—Discontinued in 1990. Reports on the numbers, geographic distribution, and characteristics of health resources are now included in Series 13.
- SERIES 15. Data From Special Surveys**—These reports contain statistics on health and health-related topics collected in special surveys that are not part of the continuing data systems of the National Center for Health Statistics.
- SERIES 16. Compilations of Advance Data From Vital and Health Statistics**—Advance Data Reports provide early release of information from the National Center for Health Statistics' health and demographic surveys. They are compiled in the order in which they are published. Some of these releases may be followed by detailed reports in Series 10–13.
- SERIES 20. Data on Mortality**—These reports contain statistics on mortality that are not included in regular, annual, or monthly reports. Special analyses by cause of death, age, other demographic variables, and geographic and trend analyses are included.
- SERIES 21. Data on Natality, Marriage, and Divorce**—These reports contain statistics on natality, marriage, and divorce that are not included in regular, annual, or monthly reports. Special analyses by health and demographic variables and geographic and trend analyses are included.
- SERIES 22. Data From the National Mortality and Natality Surveys**—Discontinued in 1975. Reports from these sample surveys, based on vital records, are now published in Series 20 or 21.
- SERIES 23. Data From the National Survey of Family Growth**—These reports contain statistics on factors that affect birth rates, including contraception, infertility, cohabitation, marriage, divorce, and remarriage; adoption; use of medical care for family planning and infertility; and related maternal and infant health topics. These statistics are based on national surveys of childbearing age.
- SERIES 24. Compilations of Data on Natality, Mortality, Marriage, Divorce, and Induced Terminations of Pregnancy**—These include advance reports of births, deaths, marriages, and divorces based on final data from the National Vital Statistics System that were published as supplements to the *Monthly Vital Statistics Report (MVSR)*. These reports provide highlights and summaries of detailed data subsequently published in *Vital Statistics of the United States*. Other supplements to the MVSR published here provide selected findings based on final data from the National Vital Statistics System and may be followed by detailed reports in Series 20 or 21.
