

1995 NHIS AIDS Knowledge and Attitudes Public Use Data file

1. The NHIS has included a supplement on AIDS since 1987. While many of the items have been asked repeatedly in most of the supplements, there have been changes and analysts are encouraged to review the questionnaire used for this survey before undertaking any analysis.

In the 1995 NHIS, questions on AIDS knowledge and attitudes were administered as a supplement to basic (core) questions for the entire year. One half of the households in the 1995 NHIS core (one sample adult per family) were asked the AIDS supplement. The other half of the households (one sample adult per family) were asked questions on the Year 2000 Objectives

The 1995 AIDS survey covered these topics:

- a. Sources of AIDS information
 - b. Knowledge about the modes of HIV transmission, clinical features of HIV infection and AIDS, and the HIV antibody test
 - c. Perceived likelihood of transmission by casual contact
 - d. Experience with blood donation and HIV antibody testing
 - e. Content of post-test counseling
 - f. Perceived effectiveness of condoms and mutual monogamy to prevent the spread of HIV
 - g. Personal knowledge of someone with AIDS or HIV
2. This year for the first time, the AIDS data begins in tape location 401 (rather than in tape location 336 as in previous years). The 1995 AIDS Knowledge & Attitudes file is structured in the following way:
 - a. The NHIS person record from the core questionnaire (locations 1-186)
 - b. Weight fields (locations 201-212)
 - c. Fields necessary for calculating variances (locations 337-352)
 - d. Data from supplement (locations 401-526)
 3. The response rate to the 1995 AIDS Survey was 78.6 percent and was calculated as follows:

The response rate to the NHIS Core questionnaire was 93.8 percent for the entire year. Of the adults eligible for the AIDS supplement, 83.8 percent responded. Multiplying these two response rates together yields the overall response rate to the AIDS Survey (78.6 percent).

4. In 1995, two types of item non-response were identified:

- (1) "No answer" (codes 8 or 98) includes blanks when there should have been a response or when an impossible code appeared
- (2) Responses of "don't know" or "refused" when the question was asked (codes 9 and 99)

NOTE: When the term "unknown" is used as a label for NA or Not applicable, it includes "not ascertained", "don't know", and/or "refused".

5. Weights and variances:

Since the NHIS uses a multistage sample design to represent the civilian non-institutionalized population of the United States, weights must be used to make accurate estimates based on data from the NHIS. Because the AIDS Survey included only one adult per two NHIS families, the weights on this tape are different from the weights for the same person on the NHIS Core Person tape.

Two weights are included on the 1995 file:

The first weight listed below (the AIDS final basic weight) will be used in most analysis of the AIDS data.

The AIDS final basic weight (loc. 207-212) differs from that calculated for the core data file in that the AIDS sample was re-weighted to account for non-response and the selection of only one adult per family. This weight will be used in conjunction with AIDS data items in file locations 401-526.

The AIDS interim basic weight before age-sex-race adjustment (loc 201-206) is required by some software packages for variance estimation for surveys with complex sample designs.

There are a number of computer programs that yield variance estimates for data based on complex sample surveys. Some are based on replication approaches and others are based on Taylor linearization approaches. In addition to the AIDS interim basic weight (which is the weight prior to poststratification), included on the AIDS file are the strata for variance estimation (loc. 337-340), the PSU for variance estimation (loc. 341), the substratum for variance estimation (loc. 342-343) and the type of PSU (loc. 351) to permit the analyst the capability of using such variance estimation procedures. These variables and weights are necessary for directly calculating sampling variances.

6. Estimating annual numbers of events or conditions

- a. To reduce respondent error, the recall period for questions about some events is limited to two weeks. These events are: bed days and other restricted activity days, work loss and school loss days, and doctor visits. The two-week variables are found in locations 98-107 and 120-121. Estimates of the total number of occurrences of these events in the population can be derived as follows:

Number of events x 26 (number of two-week periods in a year) x final basic weight = Total number of events occurring in the population during the annual period, i.e., 1995.

Example: Number of bed days (loc. 100-101) x 26 x final basic weight (loc. 207-212) = total number of bed days reported for the population in 1995.

- b. The recall period for acute incidence conditions is also two weeks and a national estimate of the total number of acute incidence conditions is calculated using the same procedures as for two-week events for the semi-annual period.

Number of acute incidence conditions x 26 x final basic weight = Total number of acute incidence conditions occurring in the population during 1995.

Note: An acute incidence condition is an acute condition with onset during the two weeks preceding the date of interview.

- c. The recall period for information on hospitalizations is 12 months. However, in calculating number of discharges (locations 132-133, 137-138), only discharges occurring in the past six months are counted.

Therefore, the weighted estimates must be calculated as follows:

Number of discharges x 2 x final basic weight = Total number of discharges occurring in the population in 1995.

7. Calculation of rates for events and conditions:

The number of events or conditions estimated for the population, as described in item 6, above, can be used as the basis for calculating rates of occurrence of these events (or conditions) per person and per 100 persons for the total U.S. population and for various population subgroups.

Note: Only rates can be estimated from these data. The percent of the population experiencing a particular type of event during the data year cannot be estimated. {The percent of the population experiencing the event in the reporting period (i.e., two weeks or six months) can be estimated but is generally not meaningful.}

8. Data on hospital episodes and days, based on a 12-month recall are in locations 122-131. The final basic weight is used for calculating estimates of these events in the same way it is used for all other person-based variables. These variables do permit estimating the percent of the population in this annual period experiencing a hospital episode in the past year and the percent of that population having a specified number of hospital days.

9. Guidelines for Citation of Data

With the goal of mutual benefit, the National Center for Health Statistics (NCHS) requests that recipients of data files cooperate in certain actions related to their use.

Any published material derived from the data should acknowledge NCHS as the original source. The suggested citation to appear at the bottom of all tables is as follows:

Source: National Center for Health Statistics (1995)

When cited in a bibliography, the suggested citation should read:

National Center for Health Statistics (1997). Data File Documentation, National Health Interview Survey of AIDS Knowledge & Attitudes 1995 (machine readable data file and documentation), National Center for Health Statistics, Hyattsville, Maryland.

The published material should also include a disclaimer that credits any analyses, interpretations, or conclusions reached to the author (recipient of the data file) and not to NCHS, which is responsible only for the initial data. Consumers who wish to publish a technical description of the data should make a reasonable effort to insure that the description is not inconsistent with that published by NCHS.
