

2012 National Health Interview Survey (NHIS)

Child Complementary and Alternative Medicine Public Use File (CAL)

IMPORTANT NOTICE FOR DATA USERS

Producing National Estimates: The frequencies presented in this document are unweighted variable frequencies, meaning that these frequencies only represent the responses from the survey respondents and cannot be used to infer national estimates. In addition, many of the CAM use variables are asked of only a subset of the sample children and therefore cannot be used *as they are* to directly estimate prevalence for the health care practices they represent.

In order to obtain accurate annual-level prevalence estimates for use of health care practices, data must be weighted using the sample child weight (WTFA_SC) and recodes are required to appropriately account for each variable's universe. For specific information about who was asked each question (variable's universe), refer to the CAL Variable Layout file.

Cost Variables: Responses to questions on the CAL Supplement about out-of-pocket cost of therapies and materials are reported exactly as reported by respondents, with the exception of upper limits placed on the cost variables (maximum value varies by question – see layout file for upper limit for each variable). Given the 12 month recall period for these questions, values may be subject to inherent memory limitations. Data users should be aware that these limitations may affect the data, although such effects have not been evaluated.
