

Inpatient Utilization of Short-Stay Hospitals by Diagnosis United States - 1972

Statistics are presented on the utilization of non-Federal short-stay hospitals based on data abstracted by the Hospital Discharge Survey from a national sample of hospital records of discharged inpatients. The number of discharges, discharge rates, and average length of stay are shown for the classes and categories of first-listed diagnoses, by demographic characteristics of inpatients discharged and by geographic region and bed size of the hospitals. For these patient and hospital characteristics, this report also presents the number and percent distribution of all-listed diagnoses (up to five diagnoses per patient) reported for inpatients discharged.

INPATIENT UTILIZATION OF SHORT-STAY HOSPITALS, BY DIAGNOSIS

Mary Moien, *Division of Health Resources Utilization Statistics*

INTRODUCTION

This report presents estimates on the diagnostic conditions of patients discharged from short-stay non-Federal hospitals during 1972. The statistics are based on data collected by the Hospital Discharge Survey (HDS), a continuous survey conducted by the National Center for Health Statistics. Since 1965, HDS has been collecting data on the characteristics of patients, their diagnoses and surgical procedures, and the characteristics of the hospitals from which they were discharged.

The estimates presented in this report are based on information obtained from the medical records of a sample of patients discharged from a national sample of general and special short-stay hospitals, excluding Federal hospitals. Data for newborn infants are excluded from this survey. The sample for 1972 included abstracts of approximately 225,000 hospital records from 424 hospitals participating in the survey. See appendix I for a description of the sample design, data collection procedures, and the estimation process. A report has been published that provides a detailed description of the HDS design and estimation techniques.¹

A maximum of five final diagnoses were coded for each medical record. The first-listed final diagnosis and all-listed final diagnoses for inpatients discharged during 1972 are presented by age, sex, and color of patients and by geographic region and size of hospitals from which they were discharged. For first-listed diagnoses the measurements of hospital utilization shown are number and rate of discharges and average

length of stay. For all-listed diagnoses the measurements are number and percent distribution of discharges.

Diagnostic data from HDS have been published for 1965-68 and 1971.²⁻⁵ Three published reports provide information on surgical operations performed in 1965, 1968, and 1971.⁶⁻⁸ Other published reports on short-stay utilization provide data on patient characteristics such as age, sex, and color and on hospital characteristics such as geographic region, bed size, and type of ownership.⁹⁻¹⁹ One report has been published on a study of charges in short-stay hospitals which the HDS conducted for 1968-70.²⁰

Another program of NCHS, the Health Interview Survey (HIS), also collects information on hospitalization. The estimates provided by HIS are generally lower for number of discharges and greater for average lengths of stay than HDS estimates because of differences in collection procedures, population sampled, and definitions. Data from HIS are published in Series 10 reports.

Definitions of the terms used in this report relating to hospitalization and patient characteristics are given in appendix II. Since several of these terms have specialized meanings in HDS, familiarity with these definitions will be useful in interpreting the data.

HOSPITALIZATION FOR ALL CAUSES

Age and Sex

An estimated 31.6 million inpatients, excluding newborn infants, were discharged from the

Nation's non-Federal short-stay hospitals in 1972. Of these inpatients, 12.6 million (40 percent) were male and 19.0 million (60 percent) female. Of the females, approximately 4.1 million were hospitalized for deliveries and other obstetrical conditions. The discharge rates per 10,000 persons in the civilian population were 1,548.6 for all discharges, 1,278.3 for males, and 1,796.8 for females. The rate for females when obstetrical conditions are excluded was 1,408.8.

Discharge rates per 10,000 increased with age. The rates were 737.4 for children under 15 years, 1,560.2 for patients 15-44 years, 1,772.3 for those 45-64 years, and 3,329.3 for patients 65 years and older. The discharge rate also increased with age for male patients. For females, however, the age group 15-44 years, the age group in which virtually all obstetrical conditions occurred, had a rate of 2,165.6 compared with 1,799.4 for females 45-64 years.

The average length of stay was 7.7 days per episode of hospitalization for all discharges, 8.3 days for males, and 7.4 days for females. Length of stay increased with age from 4.5 days for children under 15 years to 12.2 days for persons 65 years and older. The average length of stay for female discharges was lower than that for male discharges in the age groups under 65 years but was higher at age 65 and over. Average lengths of stay are shown below:

Age	Average length of stay		
	Both sexes	Male	Female
All ages-----	7.7	8.3	7.4
Under 15 years-----	4.5	4.6	4.3
15-44 years-----	5.7	6.7	5.3
45-64 years-----	9.3	9.4	9.1
65 years and over--	12.2	11.8	12.6

Color

Of the 31.6 million discharges, color was recorded on the medical record as white for 23.9 million patients (76 percent) and as other than white for 3.6 million patients (11 percent). Color was not stated for 4.1 million patients (13 per-

cent). The average length of stay was 7.8 days for white patients and 7.9 days for all other color patients. Color differences in length of stay varied by sex. White males had an 8.2-day average stay compared with 9.6 days for other color males. White females, on the other hand, had a longer average length of stay than other color females—7.5 days compared with 7.0 days.

Discharge rates were not computed by color because of the large number of patients for whom color was not stated. For this reason, caution should be used in drawing conclusions from the data by color.

Geographic Region

The number of discharges varied greatly by region, from 4.9 million in the West to 10.2 million in the South. These variations were due primarily to differences in the size of the civilian, noninstitutionalized population in the four regions. However, the discharge rates per 10,000 population varied by geographic region from 1,393.0 in the West to 1,663.1 in the North Central.

Large regional differences were also evident in the average length of stay—6.3 days in the West, 7.3 days in the South, 8.0 days in the North Central, and 9.1 days in the Northeast.

Size of Hospital

Inpatients discharged from short-stay hospitals in 1972 were distributed by size of hospital as follows:

Size of hospital	Number of discharges in thousands	Percent distribution
All sizes---	31,627	100.0
6-99 beds-----	6,825	21.6
100-199 beds-----	5,909	18.7
200-299 beds-----	5,385	17.0
300-499 beds-----	7,509	23.7
500 beds or more--	6,000	19.0

The average length of stay increased with size of hospital: 6.3 days for hospitals with 6-99 beds, 7.3 days for 100-199 beds, 7.9 days for 200-299 beds, 8.3 days for 300-499 beds, and 9.0 days for 500 beds or more.

HOSPITAL UTILIZATION BY DIAGNOSIS

Estimates of the final diagnoses of diseases, injuries, and other conditions for inpatients discharged from short-stay hospitals during 1972 are shown in this report by the classes of the *Eighth Revision International Classification of Diseases, Adapted for Use in the United States (ICDA)*,²¹ with some modifications. Estimates of diagnoses within the ICDA classes are grouped into 121 diagnostic categories for presentation in the detailed tables. Unpublished data are available from HDS for the ICDA diagnostic codes included in the 121 categories. See appendix I for a description of the grouping of the diagnostic data.

In 1972 complications of pregnancy, childbirth, and the puerperium was the leading diagnostic class with 4.1 million discharges. Other leading classes were diseases of the digestive system (4.0 million discharges); diseases of the circulatory system (3.9 million); diseases of the respiratory system (3.5 million); accidents, poisonings, and violence (3.3 million); and diseases of the genitourinary system (3.3 million discharges). Of the 17 ICDA classes, these 6 accounted for 70 percent of all first-listed diagnoses.

The detailed tables in this report provide estimates on the number, rate, and average length of stay of discharges by the classes and categories of the first-listed diagnoses. Days of care are not shown but can be estimated by multiplying number of discharges by the corresponding average length of stay for each variable. Approximate measures of the rates of days of care can be obtained by multiplying rates of discharge by the related average lengths of stay.

The diagnostic conditions shown in tables A-N were selected from among the diagnostic categories with the largest frequencies. The tables for particular age groups (tables B-E) and color groups (tables F and G) for the selected diagnoses are cross-tabulated by sex. This information does not appear in the detailed tables. The selection of the most frequently occurring diseases excludes residual classes or subclasses, symptoms, and nondiagnostic categories (observations, examinations, etc.). In the text tables the diagnostic categories of malignant neoplasms, benign neoplasms, obstetrical conditions, and

fractures are presented as single diagnostic conditions; their subcategories are not listed separately.

Diagnosis by Age and Sex

The number and rate of inpatients discharged from short-stay hospitals and their average length of stay, by ICDA class and diagnostic category, are shown by age in table 1 and by sex in table 2. Figure 1 summarizes the annual rate of discharges by ICDA class and by sex.

Table A presents data on selected diagnoses for all patients, males, and females. Complications of pregnancy, childbirth, and the puerperium accounted for 4.1 million discharges, or an annual rate of 200.9 discharges per 10,000 persons in the civilian, noninstitutionalized population. Ischemic heart disease, with 79.7 discharges per 10,000 population, was the leading nonobstetric diagnostic category. Other leading causes of hospitalization were malignant neoplasms, fractures, and hypertrophy of tonsils and adenoids, which had discharge rates of 65.4, 55.2, and 45.5, respectively.

Discharges per 10,000 population for total causes of hospitalization increased consistently with age from 737.4 for under 15 years to 3,329.3 for patients 65 years and over, or 4½ times the estimate for under 15 years. By sex, the discharge rate for females was 41 percent higher than that for males—1,796.8 and 1,278.3, respectively. Excluding obstetrical conditions, the rate for females was 1,408.8, or 10 percent higher than that for males.

Some conditions, such as malignant neoplasms and diseases of the circulatory system, had discharge rates that increased with age. The rate for malignant neoplasms increased from 5.0 for discharges under 15 years to 293.6 for those 65 years and over. Rates for diseases of the circulatory system increased from 5.6 to 982.3 as age increased. Rates for various other conditions decreased with increasing age. The rate of discharges with a first-listed condition of hypertrophy of tonsils and adenoids decreased from 122.7 per 10,000 population for those under 15 years to less than 1 per 10,000 for patients 65 years and older.

Discharge rates of males were higher than

Figure 1. Annual rate of discharges from short-stay hospitals, by diagnostic class of first-listed diagnosis and sex, excluding newborn infants: United States, 1972.

those of females for some conditions, including acute myocardial infarction, chronic ischemic heart disease, ulcers, inguinal hernia, and accidents, poisonings, and violence. Females had higher rates for diseases of the genitourinary system, cholelithiasis, and benign neoplasms (table 2).

Age group under 15 years.—An estimated 4.2 million patients under 15 years were dis-

charged from short-stay hospitals in 1972. Diseases of the respiratory system were the first-listed diagnoses for 36 percent of these children (table 1). Accidents, poisonings, and violence accounted for 14 percent of the discharges, and diseases of the digestive system, 10 percent.

Table B presents selected diagnostic conditions for children under 15 years by sex. The discharge rates were 737.4 for both sexes, 816.1

¹Includes data for sex not stated.

²Includes data for diagnostic conditions not shown in table.

for boys, and 653.4 for girls. The rate for boys was 25 percent higher than that for girls in this age group. Hypertrophy of tonsils and adenoids was the most frequent diagnosis, accounting for 15 percent of the discharged males and 19 percent of the females. The discharge rates for inguinal hernia were almost 6 times as great for boys under 15 years of age as for girls, 35.2 versus 6.0 per 10,000 population. Other conditions showing large differences in rates by sex were congenital anomalies (boys, 45.7; girls, 29.0), fractures, all sites (boys, 44.6; girls, 24.8), intracranial injury (boys, 21.7; girls, 12.0), and laceration and open wound (boys, 16.0; girls, 8.4).

The length of stay for the conditions shown in table B was shortest for hypertrophy of tonsils and adenoids (1.8 days) and longest for fractures, all sites (6.5 days). The average lengths of stay did not vary greatly by sex; in all instances the difference between the stays for boys and girls was less than 1 day.

Age group 15-44 years.—Over 30 percent of all discharges 15-44 years of age had a first-listed diagnosis of complications of pregnancy, childbirth, and the puerperium. The other classes accounting for the largest proportions of discharges were diseases of the genitourinary system (12 percent); accidents, poisonings, and violence (11 percent); and diseases of the digestive

system (10 percent). The discharge rate for patients 15-44 years was 1,560.2 per 10,000 population. The rate for males was 909.9 and that for females 2,165.6. The female rate excluding obstetrical conditions was 1,242.5, or 37 percent higher than the male rate.

Table C provides estimates of selected diagnostic conditions for patients 15-44 years by sex. An estimated 4.1 million women, 43 percent of all females discharged in this age group, were hospitalized for obstetrical conditions. The discharge rate for benign neoplasms was 7 times greater for females than for males (76.1 versus 10.8). For cholelithiasis, cholecystitis, and cholangitis, the rate for females (39.5) was 6 times that for males (6.5). Further, the rates of female discharges were twice the male rates for malignant neoplasms (females, 30.7; males, 12.3), neuroses and personality disorders (females, 42.5; males, 20.7), and hypertrophy of tonsils and adenoids (females, 35.0; males, 18.1). Males, on the other hand, had higher discharge rates for fractures (males, 67.5; females, 26.7) and laceration and open wound (males, 41.6; females, 11.7).

The average length of stay for the age group 15-44 years was 5.7 days for all discharges, 6.7 for males, and 5.3 days for females. The average stay was less for females primarily because of the large number of obstetric discharges, which

Table C. Number and annual rate of discharges and average length of stay for inpatients aged 15-44 years discharged from short-stay hospitals, by selected first-listed diagnostic conditions and sex: United States, 1972

¹Includes data for sex not stated.

²Includes data for diagnostic conditions not shown in table.

had an average length of stay of only 3.7 days. For most of the selected conditions, there was little variation in length of stay by sex. For malignant neoplasms, however, the length of stay was 12.6 days for males and 10.4 days for females. For sprains and strains of back, females had a longer length of stay (7.6 days compared with 6.5 days for males).

Age group 45-64 years.—Approximately 7.5 million discharges were in the age group 45-64 years. Diseases of the circulatory system accounted for 18 percent of all discharges in this age group (table 1). Diseases of the digestive system and diseases of the genitourinary system followed as the first-listed diagnoses for 17 percent and 13 percent of the discharges, respectively. Serious chronic illnesses, such as ischemic heart disease, diabetes mellitus, arthritis, and cerebrovascular disease, first appear among the most frequent causes of morbidity in this age group (table D). The highest discharge rates per 10,000 population were for ischemic heart disease (150.2) and malignant neoplasms (126.8). The discharge rates for other leading causes of hospitalization in this age group were 60.8 for benign neoplasms; 51.5 for fractures, all sites; and 48.3 for cholelithiasis, cholecystitis, and cholangitis.

For males 45-64 years, the conditions with the largest discharge rates were ischemic heart

disease (214.3), malignant neoplasms (111.5), and inguinal hernia (75.6). For females, the highest rates were those for malignant neoplasms (140.2), benign neoplasms (93.3), and ischemic heart disease (91.9). The discharge rate for males with ischemic heart disease was more than twice as high as the rate for females. Both the categories inguinal hernia and stomach, duodenal, and gastrojejunal ulcers had higher rates for males. The discharge rate for females with benign neoplasms was almost 4 times greater than the male rate. Females also had higher rates for malignant neoplasms and for cholelithiasis, cholecystitis, and cholangitis.

The average length of stay for males 45-64 years was 9.4 days, and the stay for females was 9.1 days. The longest length of stay for patients with the selected conditions shown in table D was for acute myocardial infarction (males, 16.1 days; females, 16.4 days). There was little variation in length of stay by sex. The largest difference was for cholelithiasis, cholecystitis, and cholangitis, for which the estimated average length of stay for males was 1.1 day longer than that for females.

Age group 65 years and over.—The age group 65 years and over represented 9.8 percent of the civilian noninstitutionalized population in 1972. However, they accounted for 21 percent of all the

Table D. Number and annual rate of discharges and average length of stay for inpatients aged 45-64 years discharged from short-stay hospitals, by selected first-listed diagnostic conditions and sex: United States, 1972

¹Includes data for sex not stated.

²Includes data for diagnostic conditions not shown in table.

patients discharged from short-stay hospitals and utilized one-third of all of the days of care provided by the hospitals. This age group had larger proportions of very sick people, as measured by the frequency of chronic incapacitating illnesses, high hospital fatality, and long average lengths of stay.

Discharges per 10,000 population 65 years and over are presented in table E for selected diagnostic conditions. The highest rates were for ischemic heart disease (445.2), malignant neoplasms (293.6), and cerebrovascular disease (207.1). These rates were much greater than those for the same conditions in the age group 45-64 years, for which the corresponding rates were 150.2, 126.8, and 34.8. Patients age 65 and over accounted for over 70 percent of all discharges with a first-listed diagnosis of malignant neoplasm of prostate (79.9 percent), fracture of neck of femur (78.3 percent), arteriosclerosis (75.5 percent), congestive heart failure (73.0 percent), and cerebrovascular disease (70.5 percent). This age group accounted for over half the frequency of several other diagnoses, among them cataract (69.4 percent) and hyperplasia of prostate (67.4 percent).

For males age 65 and over, the highest dis-

charge rates were for ischemic heart disease (516.9), malignant neoplasms (371.4), and cerebrovascular disease (221.7). The diagnostic categories with the highest rates for females were ischemic heart disease (393.3), malignant neoplasms (236.9), and fractures (210.6). Of the selected conditions shown in table E males had noticeably higher rates than females for ischemic heart disease, malignant neoplasms, and pneumonia. Females had higher rates for fractures, diabetes mellitus, and arthritis.

The average length of stay was 12.2 days for total discharges 65 years and over, 11.8 days for males, and 12.6 days for females. For the selected conditions, the lowest stay was 7.0 days for patients with cataract. Longest lengths of stay were recorded for fractures (17.8 days), acute myocardial infarction (15.2 days), and malignant neoplasms (15.0 days).

Diagnosis by Color

The number of patients and average length of stay are shown by diagnostic category and color in table 2. The leading diagnostic classes for white patients were diseases of the digestive system (3.1 million discharges); diseases of the

Table F. Number and percent of discharges and average length of stay for white inpatients discharged from short-stay hospitals, excluding newborn infants, by selected first-listed diagnostic conditions and sex: United States, 1972

²Includes data for diagnostic conditions not shown in table.

NOTE: Data in table are underreported because color was not recorded on the hospital records of an estimated 4.1 million inpatients.

circulatory system (3.0 million discharges); and complications of pregnancy, childbirth, and the puerperium (2.8 million discharges). For other than white patients, the leading classes were complications of pregnancy, childbirth, and the puerperium (764,000 discharges); accidents, poisonings, and violence (376,000 discharges); and diseases of the genitourinary system (357,000 discharges). Obstetrical conditions accounted for only 12 percent of the white discharges compared with 21 percent of the discharges among other than white patients.

The number and percent of discharges and average length of stay by selected first-listed diagnostic conditions are shown by sex for white patients in table F and for all other color patients in table G. Discharge rates were not computed because of the large number (4.1 million) of patients with color not stated. Larger percentages of white patients than of all other color patients were hospitalized due to ischemic heart disease, malignant neoplasms, hypertrophy of tonsils and

adenoids, and cholelithiasis, cholecystitis, and cholangitis. The percentages for all other color patients were larger for obstetrical conditions and for laceration and open wound.

Of white patients discharged, 40.5 percent were male and 59.5 percent female, compared with 36.3 percent male and 63.7 percent female for all other color discharges. Excluding obstetrical conditions, the sex distributions by color were identical, 46 percent male and 54 percent female.

With the exception of acute respiratory infections, the average length of stay for the selected diagnoses shown in tables F and G was shorter for white patients than for all other patients. The overall average stay for white patients was 7.8 days, and for all others it was 7.9 days. Although most of the selected diagnostic conditions showed only small differences in average stay by color, fairly large differences were found for malignant neoplasms, diabetes mellitus, and ischemic heart disease.

Table G. Number and percent of discharges and average length of stay for inpatients of the all other color group discharged from short-stay hospitals, excluding newborn infants, by selected first-listed diagnostic conditions and sex: United States, 1972

NOTE: Data in table are underreported because color was not recorded on the hospital records of an estimated 4.1 million inpatients.

Diagnosis by Geographic Region

The number of discharges, annual discharge rate, and average length of stay are presented by geographic region and diagnostic category in table 3. For all conditions, the rates per 10,000 population ranged from 1,393.0 in the West Region to 1,663.1 in the North Central Region. The West had the lowest rates for 9 of the 17 ICDA classes; the North Central Region had the highest discharge rates for 8 classes. The leading diagnostic class in three of the four regions was complications of pregnancy, childbirth, and the puerperium. In the North Central Region, however, the leading class was diseases of the digestive system, followed by obstetrical conditions. Obstetrical conditions and diseases of the circulatory system were among the three leading classes in all regions, and diseases of the digestive system appeared in the top three for all

but the West Region. Only in the West Region did accidents, poisonings, and violence appear in the three leading diagnostic classes.

The rate of discharge per 10,000 population and the average length of stay for selected first-listed conditions by geographic region are shown in table H. The discharge rates for some of the selected conditions fluctuated widely among the regions. Rates for malignant neoplasms varied from 53.4 in the South Region to 73.8 in the Northeast and North Central Regions, ischemic heart disease from 61.8 in the West to 88.1 in the Northeast; pneumonia from 25.9 in the Northeast to 45.5 in the South, and hypertrophy of tonsils and adenoids from 36.3 in the Northeast to 54.1 in the North Central Region.

For total discharges, the average length of stay in the Northeast Region was more than 40 percent higher than that in the West. The average stays were 9.1 days in the Northeast, 8.0 in

¹Includes data for diagnostic conditions not shown in table.

the North Central, 7.3 in the South, and 6.3 in the West. For the selected conditions in table H, the West Region had the shortest length of stay in every instance, and the Northeast had the longest stays with the exception of hypertrophy of tonsils and adenoids and obstetrical conditions. The largest percentage differences in average length of stay between the West and Northeast Regions

were for cerebrovascular disease and diabetes mellitus. For cerebrovascular disease, the length of stay was 9.9 days in the West compared to 16.7 days in the Northeast, or 69 percent higher. For diabetes mellitus, the average stay was 8.1 days in the West and 12.6 days in the Northeast, a difference of 4.5 days or 56 percent.

Table J. Percent of discharges and average length of stay of inpatients discharged from short-stay hospitals, excluding newborn infants, by selected first-listed diagnostic conditions and size of hospital: United States, 1972

¹Includes data for diagnostic conditions not shown in table.

Diagnosis by Size of Hospital

The number of discharges and average length of stay are shown by first-listed diagnosis and bed size of hospital in table 4. The largest proportion of patients (24 percent) were discharged from hospitals in the 300-499 bed-size group and the smallest proportion (17 percent) from hos-

pitals in the 200-299 bed-size group. As hospital size increased, the proportion of patients with a first-listed diagnosis of neoplasms, congenital anomalies, and perinatal morbidity had the largest increases of the diagnostic classes. The proportion of patients with diseases of the respiratory system and infective diseases decreased as hospital size increased. Other classes, such

as diseases of the skin and subcutaneous tissue, had virtually the same proportion of discharges in all bed-size groups.

Percent distributions of discharges and lengths of stay for selected conditions by bed size of hospital are shown in table J. Different hospital size groups treated varying proportions of these selected conditions. For example, pneumonia and acute respiratory infections except influenza comprised a larger proportion of the discharges from hospitals with less than 200 beds than from larger hospitals. The proportion of patients discharged with a first-listed diagnosis of hypertrophy of tonsils and adenoids was smallest in hospitals with 500 beds or more. These are conditions which do not require the specialized facilities of the larger hospitals. On the other hand, malignant neoplasms represented a larger proportion of the discharges from hospitals with 500 beds or more than from the smaller hospitals, because the larger hospitals usually have the specialized facilities required for treatment of this disease. Other conditions, for example, inguinal hernia and fractures, represented about the same proportion of total discharges in hospitals of all bed sizes.

Average length of stay increased with bed size from 6.3 days in hospitals with fewer than 100 beds to 9.0 days in hospitals with 500 beds and over. For most of the selected conditions in table J, average length of stay also increased as bed size of hospital increased. Some of the differences were quite large. For discharges with a first-listed diagnosis of cerebrovascular disease, the average stay increased from 11.3 days for patients in hospitals with 6-99 beds to 16.1 days for patients in hospitals with 500 beds and over. Length of stay for acute myocardial infarction and fractures was more than 4 days longer per episode of hospitalization in the largest than in the smallest hospitals.

Length of Stay

One-fourth of all patients in short-stay hospitals in 1972 were discharged within 2 days and over two-thirds (68 percent) within a week. Only an estimated 12 percent stayed over 2 weeks and 3 percent over 30 days. The cumulative percent

distribution of the number of discharges by days of care and by ICDA class is presented in table K.

The median length of stay was 3 to 4 days for patients with first-listed diagnoses in 10 of the 17 classes. At least 80 percent of the patients in 14 of the 17 classes had been discharged by the end of 2 weeks. Those classes that had more than 20 percent of the patients staying longer than 2 weeks were neoplasms, mental disorders, and diseases of the circulatory system. Eight percent of patients with a diagnosis of mental disorders remained in the hospital longer than 30 days.

As was shown in previous sections of this report, there were large fluctuations in average lengths of stay by age, sex, geographic region, and bed size of hospital. For total patients discharged, the shortest average lengths of stay were for hypertrophy of tonsils and adenoids (1.9 days) and abortion (2.2 days). The longest stays were for malignant neoplasm of large intestine and rectum (18.4 days) and fracture of neck of femur (22.6 days).

Although the average length of stay for all inpatients was 7.7 days, the average stay was 5.8 days for patients with a single diagnosis on their medical records and 10.3 days for patients with multiple diagnoses (table 7). As shown in figure 2, average length of stay increased with age for patients discharged with either single or multiple

Figure 2. Average length of stay for inpatients discharged from short-stay hospitals, excluding newborn infants, with a single diagnosis and with multiple diagnoses, by age: United States, 1972.

diagnoses. At each age level, however, patients with multiple diagnoses had longer stays than patients with a single diagnosis.

DEATHS IN SHORT-STAY HOSPITALS

Excluding newborn infants, an estimated 880,000 discharges were recorded as deaths in short-stay hospitals in 1972 (table L). This resulted in a hospital fatality rate of 2.8 deaths per 100 patients discharged. The fatality rate per 100 discharges was 3.8 for males and 2.1 for females. Of these, 3 percent were children under 15 years; approximately two-thirds (64 percent) of the deaths were patients 65 years and older. The fatality rate was lowest for patients in the 15-44 year age group, 0.5 deaths per 100 discharges. By age 65 and older, the rate had risen to 8.5

for all discharges, 9.9 for males, and 7.4 for females.

The estimated number of persons discharged dead and the hospital fatality rates for patients under and over 65 years are shown for selected conditions in table M. These data should not be interpreted as being synonymous with the mortality data reported in the official *Vital Statistics of the United States*.^{22,23} Of the estimated 880,000 discharges reported as deaths, approximately three-fourths (74 percent) were accounted for by the eight diagnostic groupings shown. The largest number of these discharges, 190,000, occurred for patients with a first-listed diagnosis of malignant neoplasms. The hospital fatality rate for patients with a first-listed diagnosis of malignant neoplasms was 14.2 deaths per 100 discharges. The highest fatality rate was 21.8 for acute myocardial infarction, followed by 19.6 for cerebrovascular disease.

Table L. Number of deaths and annual hospital fatality rate in short-stay hospitals, excluding newborn infants, by age and sex: United States, 1972

Age	Number of deaths in thousands			Fatality rate per 100 discharges		
	Total ¹	Male	Female	Total ¹	Male	Female
All ages-----	880	473	406	2.8	3.8	2.1
Under 65 years-----	314	177	137	1.3	1.8	0.9
Under 15 years-----	28	15	13	0.7	0.7	0.7
15-44 years-----	61	31	29	0.5	0.8	0.3
45-64 years-----	225	130	95	3.0	3.7	2.4
65 years and over-----	566	296	269	8.5	9.9	7.4

¹Includes data for sex not stated.

Fatality rates for patients 65 years and older were much higher than for those under 65 years. For example, the rate for patients under 65 years with acute myocardial infarction was 11.3 per 100 discharges compared with 32.5 for patients 65 years and older. For patients under 65 years, cerebrovascular disease had the highest fatality

rate (16.7), followed by malignant neoplasms (11.7) and acute myocardial infarction (11.3). For inpatients 65 years and older, the three highest fatality rates were for acute myocardial infarction (32.5), cerebrovascular disease (20.8), and malignant neoplasms (17.4).

Table M. Number of deaths in short-stay hospitals and hospital fatality rate, excluding newborn infants, by age and first-listed diagnostic conditions: United States, 1972

ALL-LISTED DIAGNOSES

Forty-three percent of the discharges in 1972 had two or more final diagnoses. By age, the estimates of patients with more than one diagnosis ranged from 29 percent of the discharges under 45 years to 68 percent of patients 65 years and over (table N). More than 40 percent of these older patients had three or more final diagnoses.

An estimated 56.1 million diagnoses were recorded for the 31.6 million patients discharged from short-stay hospitals in 1972. (A maximum of five diagnoses were coded for each medical record.) The number of diagnoses by diagnostic category, age, sex, and color of patient and by geographic region and bed size of hospital is found in table 5. The percent distribution is in table 6.

For all patients discharged there was an average of 1.8 diagnoses coded. The average number of diagnoses per discharge increased with age of patient: 1.4 for children under 15 years, 1.5 for the 15-44 year group, 2.0 for patients 45-64 years, and 2.5 for patients 65 years and older. There was, however, little or no variation in the average number of diagnoses by the other patient

characteristics or by the hospital characteristics.

The diagnostic classes with the largest number of diagnoses, in order of frequency, were diseases of the circulatory, digestive, and genitourinary systems. As first-listed diagnoses, these classes were ranked third, second, and sixth, respectively.

There was a wide range of differences in the proportions in which conditions were first-listed diagnoses and diagnoses ranked second through fifth on the medical record. Comparing the totals in table 1 of first-listed diagnoses with the totals in table 5 of all-listed diagnoses shows that over 90 percent of all diagnoses in the class complications of pregnancy, childbirth, and the puerperium were first-listed. For neoplasms, 60 percent of the diagnoses were first-listed. In contrast, only about 30 percent of the diagnoses were first-listed for diseases of the blood and blood-forming organs. Among the diagnostic categories in this report, first-listed diagnoses represent 95 percent of all diagnoses for hypertrophy of tonsils and adenoids and over 80 percent for the conditions cataract, influenza, and appendicitis, but less than 33 percent for diabetes mellitus and emphysema.

Table N. Number and percent distribution of inpatients discharged from short-stay hospitals, excluding newborn infants, by number of coded diagnoses, according to age: United States, 1972

1/ CODES 760-771, 773, AND 779 ARE NOT USED IN THE HOSPITAL DISCHARGE SURVEY.

NOTE: SEE "MEDICAL CODING AND EDIT," APPENDIX I, FOR CODING MODIFICATIONS FOR THE HOSPITAL DISCHARGE SURVEY.

APPENDIX I.

TECHNICAL NOTES ON METHODS

Statistical Design of the Hospital Discharge Survey

Scope of the survey.—The scope of HDS encompasses patients discharged from noninstitutional hospitals, exclusive of military and Veterans Administration (VA) hospitals, that have six beds or more for inpatient use, are located in the 50 States and the District of Columbia, and in which the average length of stay for all patients is less than 30 days. Although all discharges of inpatients from these hospitals are within the scope of this survey, all newborn infants and all discharges from Federal hospitals are excluded from this report.

Sampling frame and size of sample.—The sampling frame (universe) for hospitals in HDS is the Master Facility Inventory of Hospitals and Institutions (MFI). A detailed description of how the MFI was developed, its contents, plans for maintaining it, and procedures for assessing the completeness of its coverage has been published.²⁴

The universe for the survey consisted of 6,965 short-stay hospitals contained in the MFI in 1963 and another 442 hospitals which were added to the MFI in 1969. Military and VA hospitals were excluded. The distribution of the hospitals by size and region in the MFI and the HDS sample for 1972 is shown in table I.

The sample of hospitals for 1972 consisted of 497 hospitals. Of these hospitals, 45 refused to participate and 28 were out of scope either because the hospitals had gone out of business or because they failed to meet the definition of a short-stay hospital. Thus 424 hospitals participated in the survey during 1972. Approximately 225,000 abstracts of medical records were received from the 424 hospitals.

Sample design.—All hospitals with 1,000 beds or more in the universe of short-stay hospitals were selected with certainty in the sample. All hospitals with fewer than 1,000 beds were stratified, the primary strata being the 24 size-by-region classes shown in table I. Within each of these 24 primary strata, the

allocation of the hospitals was made through a controlled-selection technique so that hospitals in the sample would be properly distributed with regard to type of ownership and geographic division. Sample hospitals were drawn with probabilities ranging from certainty for the largest hospitals to 1 in 40 for the smallest hospitals.

The within-hospital sampling ratio for selecting discharges varied inversely with the probability of selection of the hospital. The smallest sampling fraction of discharged patients was taken in the largest hospitals, and the largest fraction was taken in the smallest hospitals. This was done to compensate for the fact that hospitals were selected with probabilities proportionate to their size class and to assure that the overall probability of selecting a discharge would be approximately the same in all hospitals.

In nearly all the sample hospitals, the daily listing sheet of discharges was the frame from which the subsamples of discharges were selected. The sample discharges were selected by a random technique, usually on the basis of the terminal digit(s) of the patient's medical record number—a number assigned when the patient was admitted to the hospital. If the hospital's daily discharge listing did not show the medical record numbers, the sample was selected by starting with a randomly selected discharge and taking every k^{th} discharge thereafter.

Data Collection and Processing

Data collection.—Depending on the study procedure agreed on with the hospital administrator, the sample selection and transcription of information from hospital records to abstract forms were performed either by the hospital staff, or by representatives of NCHS, or by both. In approximately 70 percent of the hospitals that participated in HDS during 1972 this work was performed by the medical records department of the hospital. In all of the remaining hospitals, the work was performed by personnel of the U.S. Bureau of the Census acting for NCHS.

Survey hospitals used an abstract form (figure I)

NOTE: The list of references follows the text.

to transcribe data from the hospital records. The abstract form provides for recording demographic data, admission and discharge dates, discharge status, and information on discharge diagnoses and surgical operations or procedures. All discharge diagnoses and operations were listed on the abstract form in the order in which they were entered on the face sheet of the hospital medical record.

Shipments of completed abstract forms from each sample hospital, along with sample selection control sheets, were transmitted to NCHS for processing.

Every shipment of abstracts was reviewed and each abstract form was checked for completeness.

Medical coding and edit.—The medical information recorded on the sample patient abstracts for data year 1972 was coded centrally by NCHS staff. A maximum of five diagnostic codes and three codes for surgical operations and treatments were assigned for each sample abstract. Following the conversion of the data on the medical abstract to computer tape, a final medical edit was accomplished by computer inspection runs and a review of rejected abstracts. If sex and/or age

CONFIDENTIAL - All information which would permit identification of an individual or of an establishment will be held confidential, will be used only by persons engaged in and for the purposes of the survey and will not be disclosed or released to other persons or used for any other purpose.

of patient were incompatible with the recorded medical information, priority was given to the latter in the editing decision.

The basic system used for coding the medical terminology on HDS sample patient abstracts is the ICDA, exclusive of the following sections:

Accidents, poisonings, and violence (external cause)-----E800-E999
Fetal death-----Y30

ICDA class XV, Certain causes of perinatal morbidity and mortality (760-779), was modified to exclude diseases, difficult labor, and conditions of mothers of newborn infants (760-771), termination of pregnancy (773), and fetal death of unknown cause (779). Birth injury without mention of cause (772) was expanded to include birth injury with mention of cause (the conditions excluded above). Codes 774-778 were also retained. The supplementary classification presented for special conditions without sickness (Y00-Y13) also includes code 793, which was modified to cover observation and tests with negative or unspecified findings. These modifications of the basic coding system were made to accommodate incomplete or ill-defined terminology on the source documents.

Presentation of Estimates

Grouping of diagnoses.—The diagnostic classes, the broadest groupings of diseases and injuries shown in this report, correspond to ICDA classes I-XVII. The diagnostic categories, the most detailed groupings of

diseases and injuries shown in this report, are subsets of the major groups or classes. The titles and the ordering of the categories on the standard tabular list developed for this report follow the format of the ICDA tabular list as closely as possible. In developing the discrete category groupings, an effort was made to maximize specificity of the conditions consistent with clarity of characterization and with the frequency of their occurrence within the context of HDS for 1972.

Patient characteristics "not stated."—Age of patient and sex of patient were not stated on the hospital record of the sample hospital (the face sheet of patient's medical record) for less than one-fourth of 1 percent of the discharges. If age was not stated, it was imputed by assigning the patient an age consistent with the ages of the other patients with the same diagnostic code. If the date of admission or discharge was not given and could not be obtained from the monthly sample listing sheet transmitted by the sample hospital, a length of stay was imputed by assigning the patient a stay consistent with the stays of other patients of the same age. Other missing demographic items were coded and tabulated as "not stated." Color, on the other hand, was not stated for 12.5 percent of all discharges. For this reason, rates by color were not computed and caution should be used in drawing conclusions from the data by color. In the detailed tables presenting frequencies, rates, and average lengths of stay, the totals include the "not stated" cases.

Rounding of numbers.—Estimates of the number of discharges have been rounded to the nearest thousand for tabular presentation. For this reason, detailed figures within the tables do not always add to totals.

Table II. Civilian, noninstitutionalized population used to compute rates shown in this publication, by age, sex, and geographic region: United States, July 1, 1972

Population group	Both sexes	Male	Female
	Population in thousands ¹		
Total-----	204,229	98,511	105,718
<u>Age</u>			
Under 15 years-----	56,609	28,844	27,764
15-44 years-----	85,445	41,313	44,133
45-64 years-----	42,248	20,054	22,194
65 years and over-----	19,927	8,300	11,627
<u>Geographic region</u>			
Northeast-----	49,011
North Central-----	56,727
South-----	63,357
West-----	35,134

¹These estimates of the U.S. civilian, noninstitutionalized population are consistent with the population estimates published by the U.S. Bureau of the Census in Current Population Reports, Series P-25.

Rates, percents, and average lengths of stay presented in the report were calculated on the basis of unrounded figures and will not necessarily agree with rates and other calculations that may be calculated from the rounded data.

Population estimates.—The population estimates used in computing rates for 1972 HDS data are unpublished estimates for the U.S. civilian, noninstitutionalized population as of July 1, 1972, provided by the U.S. Bureau of the Census.

The population estimates for the United States by age, sex, and geographic region, presented in table II, are consistent with the population estimates published by the U.S. Bureau of the Census in *Current Population Reports*, Series P-25. However, they are not official population estimates of the U.S. Bureau of the Census.

Reliability of Estimates

Estimation.—Statistics produced by HDS are derived by a complex estimating procedure. The basic

NOTE: The list of references follows the text.

unit of estimation is the sample inpatient discharge abstract. The estimating procedure used to produce essentially unbiased national estimates in HDS has three principal components: (1) inflation by reciprocals of the probabilities of sample selection, (2) adjustment for nonresponse, and (3) ratio adjustments to fixed totals. These components of estimation are described in appendix I of two earlier publications.^{9,10}

Measurement errors.—As in any survey, the results are subject to nonsampling or measurement errors, which include errors due to hospital nonresponse, missing abstracts, information incompletely or inaccurately recorded on abstract forms, and processing errors. Some of these errors were discussed in earlier sections. Quality control programs have been instituted to alleviate these types of errors.

Sampling errors.—The standard error is primarily a measure of the variability that occurs by chance because a sample rather than the entire universe is surveyed. In this report, the standard error also reflects part of the measurement error, but it does not measure any systematic biases in the data. The relative standard error of the estimate is obtained by di-

Figure II. Approximate relative standard errors of the estimated numbers of patients discharged from all short-stay hospitals, and by geographic region and size of hospital.

Illustration of use of figure II: As shown in table 3, an estimated 78,000 patients were discharged during 1972 from short-stay hospitals within the North Central Region with a first-listed diagnosis of cataract. The relative standard error of this estimate as read from the curve "Region groups" is approximately 8.8 percent: the standard error of 78,000 is 6,864 (8.8 percent of 78,000).

viding the standard error of the estimate by the estimate itself and is expressed as a percentage of the estimate.

The chances are about 68 out of 100 that the value obtained in a complete enumeration is contained in the interval represented by the estimate plus or minus one standard error of the estimate, 95 out of 100 for two standard errors, and 99 out of 100 for 2 ½ standard errors. Applying the illustration at the bottom of figure II, the chances are about 68 out of 100 that the value that would be obtained in a complete enumeration is contained in the interval $78,000 \pm 8.8$ percent of 78,000 (between 71,136 and 84,864); 95 out of 100 for the interval $78,000 \pm 8.8$ percent of 78,000 multiplied by 2; 99 out of 100 for the interval $78,000 \pm 8.8$ percent of 78,000 multiplied by 2.5.

The standard error of one statistic is generally different from that of another, even when the two come from the same survey. In order to derive standard errors that would be applicable to a wide variety of statistics and that could be prepared at a moderate cost, a number of approximations are required. As a

result, figure II and table III shown in this section provide general standard errors for a wide variety of estimates rather than the specific error for a particular statistic.

The relative standard errors (figure II) and approximate standard errors of percentages (table III) that have been prepared for this report are applicable to estimates of discharges and number of diagnoses for all hospitals, and to diagnostic class and category cross-tabulated by age, sex, color, geographic region, and size of hospital. The curve in figure II to which one refers to obtain a sampling error is contingent on whether the type of estimate (e.g., discharges) relates to all hospitals, a geographic region, or a hospital-size group. The approximate standard errors of estimated percentages in table II, when the characteristic(s) used to form the numerator of the percentage is a subclass of the denominator, are applicable to all percentages presented in this report. Relative standard errors are not available for estimates of discharges by average length of stay.

Table III. Approximate standard errors of percentages shown in this report for discharges or diagnoses: all hospitals, patient characteristics, geographic regions, and hospital sizes

Number of discharges or diagnoses (base of percent in thousands)	Estimated percent					
	2 or 98	4 or 96	10 or 90	20 or 80	30 or 70	50
	Standard error expressed in percentage points					
50-----	1.0	1.4	2.1	2.8	3.3	3.5
100-----	0.7	1.0	1.5	2.0	2.3	2.5
200-----	0.5	0.7	1.1	1.4	1.6	1.8
600-----	0.3	0.4	0.7	0.8	1.0	1.1
1,000-----	0.2	0.3	0.5	0.6	0.7	0.8
2,000-----	0.2	0.2	0.4	0.5	0.5	0.6
6,000-----	0.1	0.1	0.2	0.3	0.4	0.4
10,000-----	0.1	0.1	0.2	0.2	0.3	0.3
20,000-----	0.1	0.1	0.1	0.2	0.2	0.2
30,000-----	0.1	0.1	0.1	0.1	0.1	0.1

Illustration of use of table III: Table 7 shows that 45.8 percent of the 421,000 diagnoses of displacement of intervertebral disc reported in table 6 were for patients aged 15-44 years. Linear interpolation between the values shown in table III yields an approximate standard error of 1.4 percent for an estimate of 45.8 percent with a base of 421,000.

APPENDIX II.

DEFINITIONS OF CERTAIN TERMS USED IN THIS REPORT

Terms Relating to Hospitalization

Short-stay hospitals.—General and short-stay special hospitals having six beds or more for inpatient use and an average (mean) length of stay of less than 30 days. Federal hospitals and hospital units of institutions are not included. The terms "hospitals" and "short-stay hospitals" are used synonymously.

Inpatient.—A person who is formally admitted to the inpatient service of a short-stay hospital for observation, care, diagnosis, or treatment. In this report, the number of inpatients refers to the number of discharges during 1972, including multiple discharges (if any) of the same individual from one short-stay hospital or more. Newborn infants admitted by birth to the hospital from which they are discharged are excluded in this report. The terms "inpatient" and "patient" are used synonymously.

Discharge.—The formal release of an inpatient by a hospital, that is, the termination of a period of hospitalization by death or by disposition to place of residence, nursing home, or another hospital. In this report, the number of discharges from short-stay hospitals (alive or dead) is exclusive of newborn infants. The number of discharges by death is limited to hospital deaths that occurred following formal admission of the patient to the inpatient service of the short-stay hospital. The terms "discharges" and "patients (or inpatients) discharged" are used synonymously.

Discharge rate.—The ratio of the number of hospital discharges (inpatients) during 1972 to the number of persons in the civilian, noninstitutionalized population as of July 1, 1972.

Episode (hospital).—A continuous period of inpatient stay in one hospital from date of admission to (but not including) date of discharge. In this survey, the number of hospital episodes (inpatients) in short-stay hospitals is equivalent to the number of discharges.

Average length of stay.—The total number of inpatient days accumulated at time of discharge by patients discharged during 1972 divided by the number of patients discharged. A stay of less than 1 day (admission and discharge on the same calendar day) is counted as 1 day in the summation of total inpatient days. The terms

"average length of stay," "average duration," and "duration of stay" are used synonymously.

Size of hospital.—Measured by the number of beds, cribs, and pediatric bassinets regularly maintained (set up and staffed for use) for inpatients; bassinets for newborn infants are not included. In this report the classification of hospitals by bed size is based on the number of beds at or near midyear reported by the hospitals.

Terms Relating to Diagnoses

Discharge diagnosis(es).—One or more diseases or injuries (or special conditions, examinations without sickness, etc.) that the attending physician assigns to the medical record of discharged patients. In this survey, all discharge (or final) diagnoses listed on the face sheet (summary sheet) of the medical record for patients discharged from the inpatient service of short-stay hospitals are transcribed in the order listed. A maximum of five ICDA 3-digit or 4-digit codes are assigned per sample discharge.

All-listed diagnoses.—In terms of the classification system used and the processing of not more than five codes per sample discharge, the estimated number of discharge (or final) diagnoses for inpatients discharged from non-Federal short-stay hospitals during 1972. The aggregate of individually coded diagnoses listed in positions 1-5 (see "first-listed diagnoses" and "additional diagnoses").

First-listed diagnoses.—The aggregate of individually coded diagnoses listed first, including single (only) and first of multiple discharge diagnoses. The number of first-listed diagnoses is equivalent to the number of discharges.

Additional diagnoses.—The aggregate of individually coded diagnoses listed in positions 2-5.

Nonobstetric discharges.—The number of inpatients discharged, excluding patients whose first or only discharge diagnosis was a delivery or complication of pregnancy or the puerperium (ICDA class XI).

Obstetrical condition.—Any condition in ICDA class XI.

Fatality rate.—The ratio of the number of patients

discharged dead to the total number of patients discharged (alive or dead). Fatality rates for a specific disease or disease group are based on the classification of discharges by the first or only diagnosis, and not on underlying cause of death.

Demographic Terms

Age.—Refers to age at last birthday prior to admission to the hospital inpatient service.

Color.—In this report, patients are classified into two groups, "white" and "all other," based on information available on the hospital records (face sheet of the inpatient's medical record) of sample hospitals.

United States.—The 50 States and the District of Columbia.

Geographic region.—In this report hospitals are classified by location according to the four geographic regions of the United States which correspond to those of the U.S. Bureau of the Census. The States included in each region are as follows:

<i>Region</i>	<i>States Included</i>
Northeast -----	Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania
North Central---	Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas
South -----	Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, Texas
West -----	Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska, Hawaii

VITAL AND HEALTH STATISTICS PUBLICATIONS SERIES

Formerly Public Health Service Publication No. 1000

- Series 1. Programs and Collection Procedures.*—Reports which describe the general programs of the National Center for Health Statistics and its offices and divisions, data collection methods used, definitions, and other material necessary for understanding the data.
- Series 2. Data Evaluation and Methods Research.*—Studies of new statistical methodology including experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, contributions to statistical theory.
- Series 3. Analytical Studies.*—Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
- Series 4. Documents and Committee Reports.*—Final reports of major committees concerned with vital and health statistics, and documents such as recommended model vital registration laws and revised birth and death certificates.
- Series 10. Data from the Health Interview Survey.*—Statistics on illness; accidental injuries; disability; use of hospital, medical, dental, and other services; and other health-related topics, based on data collected in a continuing national household interview survey.
- Series 11. Data from the Health Examination Survey.*—Data from direct examination, testing, and measurement of national samples of the civilian, noninstitutionalized population provide the basis for two types of reports: (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics; and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.
- Series 12. Data from the Institutionalized Population Surveys.*—Discontinued effective 1975. Future reports from these surveys will be in Series 13.
- Series 13. Data on Health Resources Utilization.*—Statistics on the utilization of health manpower and facilities providing long-term care, ambulatory care, hospital care, and family planning services.
- Series 14. Data on Health Resources: Manpower and Facilities.*—Statistics on the numbers, geographic distribution, and characteristics of health resources including physicians, dentists, nurses, other health occupations, hospitals, nursing homes, and outpatient facilities.
- Series 20. Data on Mortality.*—Various statistics on mortality other than as included in regular annual or monthly reports. Special analyses by cause of death, age, and other demographic variables; geographic and time series analyses; and statistics on characteristics of deaths not available from the vital records, based on sample surveys of those records.
- Series 21. Data on Natality, Marriage, and Divorce.*—Various statistics on natality, marriage, and divorce other than as included in regular annual or monthly reports. Special analyses by demographic variables; geographic and time series analyses; studies of fertility; and statistics on characteristics of births not available from the vital records, based on sample surveys of those records.
- Series 22. Data from the National Mortality and Natality Surveys.*—Discontinued effective 1975. Future reports from these sample surveys based on vital records will be included in Series 20 and 21, respectively.
- Series 23. Data from the National Survey of Family Growth.*—Statistics on fertility, family formation and dissolution, family planning, and related maternal and infant health topics derived from a biennial survey of a nationwide probability sample of ever-married women 15-44 years of age.
