VITAL STATISTICS OF THE UNITED STATES

PART II. GEOGRAPHIC CLASSIFICATION BY PLACE OF RESIDENCE

INTRODUCTION

This volume—Vital Statistics of the United States, Part II—contains official natality and mortality statistics tabulated according to the place of residence of the mother of the child, or the place of residence of the decedent. Data compiled on a place-of-occurrence basis are published in a volume entitled "Vital Statistics of the United States, Part I." The tabulations published in both part I and part II are compiled from the same source material, being derived from transcripts of original birth and death certificates received from registration officials of States and cities, and of the outlying territories and possessions of the United States.

The tables given in this volume should be interpreted with some caution since several factors enter into the determination of the place of residence. The place of birth or death, in most cases, is clear-cut and definitely determinable. To determine the place of residence is more difficult because it is dependent upon definitions of residence as well as the completeness of the information given on the certificate. It has, therefore, been necessary to adopt a set of arbitrary rules for the proper coding in each instance. The data obtained by a reallocation of nonresidents are obviously dependent upon these rules and cannot be correctly interpreted unless the rules are exactly and clearly stated.

THE VALUE OF VITAL STATISTICS TABULATED BY PLACE OF RESIDENCE

Tabulated vital statistics may be used for many purposes, each requiring data classified by different groupings or according to different definitions. Many of these uses relate to public health work, such as an evaluation of the problems confronting public health agencies or the measurement of the results of public health programs. Other uses relate to maternal- and infant-welfare activities, problems of population research, analysis of fertility trends, actuarial investigations, medical research, et cetera. For some purposes, such as a study of the hospital load carried by a given community, the proportion of births attended by physicians, or the simple ranking of causes of death, it is possible to use tabulated natality and mortality data without relating them to other statistical data. But for the most part, vital statistics take on their full value only when related to population figures by the computation of birth or death rates. For deaths, these rates, in their simplest form, consist of ratios of the number of deaths occurring in a specified place during a specified time to the number of persons exposed to the risk of death at that place and time. It is obvious that such a rate can be correctly computed and interpreted only when the population figure in the denominator and the mortality figure in the numerator are compiled on a comparable basis. In other words, the population figure must represent a certain group that is exposed to the risk of death, and the death figure must include all of this group that died. Although the birth rate is interpreted in a different manner, similar considerations apply to it.

For the United States, as a unit, there is little difficulty in securing adequate comparability between vital statistics and population figures. However, for individual cities or counties or for population-size groups, there are several disturbing factors. In the population census, each person is counted as a part of the population of the geographic unit in which he has his "usual place of residence." Therefore, the enumerated population of a city is a count of all the persons who usually live in that city, excluding persons who are temporarily in the city at the time of the census and including residents of the city who are at some other place during the time of the population enumeration.

The crude death rate for the residents of any area must be based on the total resident population of that area and the total number of deaths occurring in this total resident population. It is essential to include the deaths of residents no matter where the deaths occurred, and to exclude deaths of nonresidents occurring in that area.

The occurrence of a large number of births and deaths "away from home" results from the movement of the people, facilitated by convenient methods of transportation, and from the increasing use of hospitals during confinement and illness. Seasonal movement to and from resort States, seasonal migration in search of employment, and the movement of people to some other area for hospital facilities not available in their usual place of residence, are several of the factors that contribute to the number of nonresident births and deaths.

Inasmuch as the registration laws of each State specify that births and deaths be registered at the place of birth or death, the compilation of vital statistics according to place of occurrence is the most direct and usual method. Rates computed on this basis may be called *recorded* rates, since all the births or deaths

recorded in each area are included in the computation. The compilation of natality and mortality data on the same geographic basis as the population census requires a complete reallocation of births and deaths to the place of residence. When this reallocation has been made, it is then possible to compute *resident* rates. Since resident death rates are ratios of the number of deaths to the number of persons exposed to the risk of death, they indicate more accurately the force of mortality affecting a given population and can therefore be interpreted in terms of relative health conditions. Resident birth rates are interpreted somewhat differently, but similar considerations apply to them. Of course, in such interpretations, cognizance must be taken of other factors, such as the age, sex, and race distributions of the exposed populations.

From some points of view it may seem incorrect to allocate deaths purely on a place-of-residence basis without taking into account the city or county responsible for the causes resulting in death. For example, a resident of one city may be killed in an automobile accident in another city. In such a case it may seem unreasonable to allocate that death to the city of residence if the accident was caused by traffic hazards of the city where the death occurred. However, even if desirable, the reallocations of deaths from most causes to the area reponsible for the conditions resulting in death would be a highly speculative and difficult task. Furthermore, admitting the possibility of making such an assignment of deaths, it then becomes necessary to devise an "exposed-to-risk" figure quite different from an enumerated population.

Tabulations of vital statistics by place of occurrence are valuable and necessary for certain purposes. Tabulations by place of residence and the computation of resident birth and death rates provide data of greater value and meaning for many uses. However, resident data cannot be directly interpreted for every purpose. No single method of tabulation could be devised that would provide statistics compiled in the manner necessary for all possible problems.

PREVIOUS TABULATIONS BY PLACE OF RESIDENCE [1]

The first nonresident tabulations made by the Bureau of the Census were published in the volume of "Mortality Statistics" for 1914. These tabulations included deaths, but not births, and consisted merely of a separation of nonresident deaths from the total deaths for each area. However, discovery of serious deficiencies in the place-of-residence information given on the death certificates resulted in the omission of nonresident tabulations from the published volumes from 1915 to 1917, inclusive. By 1918 it was believed that sufficient progress had been made with the basic data to resume publication of nonresident statistics.

In 1918 the nonresident mortality tabulations were revised so as to provide a complete allocation of deaths by place of residence within the limits of the then incomplete registration area. A decedent in the registration area whose place of residence was outside the registration area could not be reallocated to his place of residence. Similarly, deaths of residents of the registration area could not be included in the figures for this area if the deaths had occurred outside the registration area.

Tables showing the number of deaths by place of residence were published for each year from 1918 to 1930, inclusive. The rules for residence allocation remained essentially unchanged during this period. In 1931 the tabulation of nonresident deaths was discontinued as an economy measure, and for the years 1931 to 1934, inclusive, no data on this important subject are available.

The completion of the birth- and death-registration areas in 1933 made possible, for the first time, a Nation-wide reallocation of nonresidents to the place of residence. When the nonresident reallocation was resumed in 1935, the definition of a nonresident was revised and more detailed rules for allocation were formulated. In addition, compilation by place of residence was extended to birth statistics. Previous to 1935, no reallocation of births to place of residence of the child's mother had been made by the Bureau of the Census.

Resident tabulations for 1935 and 1936 were made but were not published in the annual volumes—"Birth, Stillbirth, and Infant Mortality Statistics" or "Mortality Statistics." However, they were released in the series of "Vital Statistics—Special Reports." [2]

The publication in 1937 of a combined volume of natality and mortality data tabulated by place of residence marked an important change in the compilation of national vital statistics. Since then, the tabulations by place of residence have been expanded considerably.

NONRESIDENT TABULATIONS BY STATE OFFICES

Since vital statistics tabulations by place of residence are important in public health administration, many State departments of health compile natality and mortality data on this basis. A survey by the Bureau of the Census in 1935 revealed that 11 States were making rather complete resident reallocations and 8 States were publishing tables showing the number of deaths for cities and counties including and excluding deaths of nonresidents. A survey was made in 1938 by a Committee on Residence Allocation under the

National Office of Vital Statistics (formerly

auspices of the Vital Statistics Section of the American Public Health Association. This survey indicated that 24 States were making regular tabulations involving the reallocation of nonresidents.

Answers to a questionnaire sent to all the States by the Bureau of the Census in 1941 indicated that 35 States and the District of Columbia were making some resident tabulations. In 4 States, these tabulations were limited to the separation of residents and nonresidents with no allocation to place of residence. In 13 States, the tabulations excluded nonresidents from other areas within the State and included residents who were born or who died elsewhere within the State; however, the tabulations in these States did not exclude nonresidents from other States or include residents of the State who were born or who died in another State. Nineteen States made complete place-of-residence tabulations excluding all nonresidents and including all residents within and outside the State.

In many States the resident tabulations are based solely on a reallocation of nonresidents within the State. In other words, these States do not include in their tabulations the deaths (or births) of residents of that State occurring in other States. For State totals, the allocation of interstate nonresidents is, in most cases, numerically unimportant. However, for areas near a State border, interstate realloaction may be very important since many deaths (or births) of residents of the area may occur in the adjacent State.

To assist the States in obtaining records of births or deaths of their residents in other States, the Vital Statistics Section of the American Public Health Association adopted, in 1931, a resolution requesting the Bureau of the Census to act as a clearing house in the exchange of such records. Since 1933, most States have sent to the Bureau of the Census copies of birth and death certificates for out-of-State nonresidents and these have been forwarded to the State of residence. Although this interstate exchange has been of considerable value to the individual States, it has not solved all of the difficulties met by State agencies in making a complete reallocation.

Differences of opinion exist regarding the principles on which the definition of a nonresident and the rules used for coding should be based. For this reason the interstate transfer is not on a strictly uniform basis for all States. Some indication of the amount of variation among States can be seen in the following table. In this table the number of nonresidents of each State, according to the definitions of the National Office of Vital Statistics, is compared with those identified by the separate State offices. These comparisons are based upon transcripts which have been cleared through the National Office of Vital Statistics. Since some interchange of nonresident transcripts is still made directly, these ratios do not completely represent the differences in State procedures. The table shows for both births and deaths the number of nonresident transcripts to be subtracted from the tabulations of each State, and the number of resident transcripts to be added. A study of the figures in this table, and particularly of the ratios between Federal and State figures, will indicate the existence of many differences in State procedures. While State tabulations fulfill an important need, it is obviously desirable for some central agency, operating with a uniform although arbitrary set of rules, to make Nation-wide tabulations.

One significant comment should be made regarding the differences between resident tabulations made by State agencies and those made by the National Office of Vital Statistics. Because of the large number of transcripts involved in national tabulations, the coding rules used by the National Office of Vital Statistics must be designed and simplified to facilitate mass production. Furthermore, it does not have access to the detailed local information necessary for certain types of allocation. For these reasons, it is not practicable to introduce all possible coding refinements or to use different sets of rules for various causes of death. Many State offices, having special local problems or interests to meet, wish to use special coding rules for certain groups of data. For example, some States either allocate deaths in custodial institutions to the place of prior residence or consider these institutions as separate tabulation areas. Some States prefer to allocate deaths from infectious diseases to the area where the infection presumably originated; deaths from accidents, to the place of accident; deaths from homicide, to the place of homicide, et cetera.

The desirability of these special types of tabulation should be emphasized, but they often require detailed information available only in local offices and involve operating rules feasible only for a relatively small volume of work. Therefore, while it is desirable for a central agency to make national tabulations, these national uniform tabulations do not replace those made by the separate State agencies.

DEFINITION OF RESIDENCE

The reallocation of births and deaths to place of residence is based on information somewhat different and collected in a manner different from that obtained in the enumerated population census. It is obviously not possible to use identical rules for both compilations. The tabulation of vital statistics on a place-of-residence basis requires that the information given on the certificate be interpreted in such a way as to result in classifications comparable with the population census figures. The necessity for such interpretation introduces arbitrary and controversial factors into the procedure of allocation. It can hardly be expected that the geographic classification by place of residence can be as direct and simple as the classification by place of occurrence.

In addition to difficulties in the definition of residence, there are several factors in the original collection of birth and death information that may produce errors or discrepancies in residence tabulations. The place of birth or death is usually obvious or easily learned by the person filling out the original certificate. On the other hand, the original informant or the State office may have to make an inquiry to determine the place of residence, particularly in the case of nonresident births or deaths. Since it is sometimes difficult to ascertain the precise geographic location of the place

of residence, errors may be made occasionally. Because of these difficulties of residence designation and because of incomplete understanding of the importance of residence data, the residence information may be omitted or incompletely reported on birth and death certificates for certain areas.

Relation of geographic code to the identification of nonresidents.—Whether or not a person is classified as a nonresident depends somewhat upon the size of the area under consideration. A resident of Maine may die in California, yet this fact may be ignored when only totals for the United States are concerned. For State totals, only those persons who cross State lines need be considered in a reallocation by place of residence, since any movement within the State is irrelevant. On the other hand, for the study of mortality conditions within a city (for individual census tracts or wards), it is necessary to use a much finer definition of a nonresident. In such cases it may be necessary, for example, to define as a nonresident a person who lived on one side of a street and died in a hospital on the other side of the same street.

In whatever way the place of residence may be defined, the size of the tabulation or coding unit will partially determine the number of identified nonresidents. If the coding unit—assuming the use of a punch-card system in which geographic areas are given numerical codes—is a whole county, obviously it is impossible to determine, from a tabulation of the cards, the number of persons who moved about within the county. If the coding unit is a single registration district, it will be possible to identify persons moving from one district to another within the county, but it will not be possible to measure the movement within districts.

The tabulations given in this volume are based on a geographic code that identifies each city or other urban place having a population of over 10,000 in 1940 and each county excluding these cities or urban places. The code for the county (exclusive of the cities or urban places of 10,000 or more) is subdivided into two codes, one for all urban places of 2,500 to 10,000 as a group, and another for all villages under 2,500 and rural areas as a group. In coding the place of residence, movement from an urban place or city of 2,500 or more to another place or city of 2,500 or more, in the same or a different county, is identified. Similarly, any population movement from one county to another is identified, including movement to or from rural areas in different counties. However, movement from a village under 2,500 or from a rural area to another village under 2,500 or rural area within the same county is not identified.

Another limitation should be mentioned. If, for example, the nonresident deaths for each urban place and county within a State are tabulated, it is not possible to add these figures together and obtain the number of nonresidents of the whole State. Such addition will give the number of persons in the State who died in a tabulation-unit area other than the area of their residence, but it will not give the number of nonresidents of the State since a nonresident in an urban place may be a resident of some rural area or some other urban place in the same State. Therefore, the term "nonresident" may have one or two meanings. In reference to the smallest unit of tabulation (in this report an urban place or county), a nonresident is a person who died within that unit but whose usual place of residence was in some other unit. In reference to a consolidation of separate geographic units (for example, a whole State), the term refers to the number of persons dying therein who are nonresidents of the particular place of death but are not necessarily nonresidents of the consolidated area. Furthermore, since the nonresidents of one area are necessarily residents of some other area, it is necessary to apply both terms to the same data when considered in different aspects. In order to avoid confusion, the tables given in this volume include headnotes or footnotes when additional explanation seems necessary.

Allocation of deaths to place of residence.—The allocation of deaths to the place of residence is based on the following general principles and rules.

1. Mortality data should be compiled so as to correspond with enumerated populations on which rates are to be based. Each death should be assigned to the area which was the "usual place of residence" of the decedent.

2. A decedent is defined as a nonresident if the place of residence stated on the certificate is different from the place of death. However, decedents who at the time of death had been living more than 1 year in a community are considered residents of that community even though some other place of residence is stated.

3. Decedents in nonresident institutions such as general hospitals, tuberculosis sanatoriums, convalescent homes, jails, et cetera, are reallocated to the usual place of residence, if they had been in the institution less than 1 year.

4. Decedents in resident institutions, where length of stay is usually long, such as mental institutions; orphanages; homes for the aged, blind, and deaf; et cetera, are not reallocated to the place of prior residence.

5. Decedents whose usual place of residence is a foreign country or a United States possession outside the United States are not reallocated to the usual place of residence.

6. Infants born at other than the place of residence of the mother, who died in that same place, are reallocated to the place of residence of the mother.

For the purpose of coding mortality transcripts, these rules have been expanded into definite coding instructions which state the procedure followed in each case. These instructions have been published in the Instruction Manual of the Vital Statistics Division.[3]

Special residence instructions for military personnel.—On all death certificates having indications that the deceased was a member of the Army, Navy, or Marine Corps, the usual place of residence is the post or port at which the deceased was stationed.

In cases where the death occurred while the person was in the process of being transferred from one post to another, the person is to be considered a resident of the post from which he was being transferred.

In cases where the death occurred while on land maneuver or leave, the usual place of residence is the post at which the deceased was stationed.

If the death occurred aboard a naval vessel at sea, the place of death will be the vessel and the death certificate should have been filed at the first port of call. If a permanent station is not indicated, the place of residence of the deceased is assumed to be the place of residence of the nearest relative to the deceased.

Allocation of births to place of residence.—The allocation of live births and stillbirths is made according to the same general principles as the allocation of deaths. In the case of births, however, the residence of the mother is considered to be the place of residence of the child,

For the purpose of coding natality transcripts, these rules have been expanded into definite coding instructions which state the procedure followed in each case. These instructions have been published in the Instruction Manual of the Vital Statistics Division.[3]

TABLE 2.—BIRTHS, DEATHS, DEATHS UNDER 1 YEAR, AND STILLBIRTHS, AND INFANT MORTALITY RATES, URBAN AND RURAL: UNITED STATES, EACH STATE AND COUNTY, AND EACH URBAN PLACE HAVING, IN 1940, A POPULATION OF 10,000 OR MORE, 1945

[By place of residence. Exclusive of stillbirths and of deaths among armed forces overseas. Infant mortality rates per 1,000 live births in a specified race group. Stillbirths include those for which the period of uterogestation was 5 months or more or not stated. White and nonwhite are shown separately for those counties and urban places in which the 1940 populations for nonwhite races formed 10 percent or more of the total, or numbered 10,000 or more]

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County. Likewise, total figures for Yellowstone National Park are shown under Wyoming.

TABLE 5.—LIVE BIRTHS BY AGE OF MOTHER, BIRTH ORDER, RACE, AND NATIVITY OF WHITE MOTHER: UNITED STATES AND EACH STATE, 1945

[By place of residence. Birth order refers to number of children ever born alive to mother. Figures on birth order for Massachusetts are included in the "total" and "not stated" classifications only; they are not given by birth order because this State does not require the reporting of such information]

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N.C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County. Likewise, total figures for Yellowstone National Park are shown under Wyoming.

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N.C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County. Likewise, total figures for Yellowstone National Park are shown under Wyoming.
