VITAL STATISTICS OF THE UNITED STATES, 1973

VOLUME III-MARRIAGE AND DIVORCE

A brief summary of the contents for each section is listed below for the convenience of the reader. A complete table of contents is shown at the beginning of each section and is identified by a narrow black edge which can be located easily by fanning the pages. Each section is paged independently, using the section number as the identifying prefix.

Section 1. Marriages

For the United States:

National trend data.

Marriage totals and rates for each State, division, and region.

Marriage totals for each county or county equivalent.

Monthly marriage totals for each State, division, and region.

For the marriage-registration area:

Marriages classified by major demographic characteristics of bride and groom and by characteristics of marriage performed in each participating State; marriage rates specific for sex, age, and previous marital status.

Section 2. Divorces

For the United States:

National trend data.

Divorce totals and rates for each State, division, and region.

Divorce totals for each county or county equivalent.

Trend of national totals of children involved in divorce.

For the divorce-registration area:

For each participating State, divorce classified by major demographic characteristics of husband and wife, characteristics of their marriage, and number of children.

Section 3. Puerto Rico and Virgin Islands (U.S.)

Marriage and divorce totals for each county or county equivalent.

Marriages classified by major demographic characteristics of bride and groom.

For Virgin Islands only, divorces and annulments classified by characteristics of husband and wife, duration of marriage, and number of children.

Section 4. Technical Appendix

Historical and contemporary sources of marriage and divorce statistics, design of the samples of marriages and divorces and annulments, variability of sample estimates, and uniformity and completeness of the reporting forms and the collected data. Tables of the population estimates used as bases for rates.

Sampling Variability of the Marriage Statistics

In the tables which present statistics based on data from probability samples of marriage records, small frequencies have high sampling variability, which limits their usefulness. The sampling errors are shown in table 4-6 in the Technical Appendix. It is suggested that any number smaller than those shown be interpreted simply as "small" rather than as any more precise value. The true number would very probably be within 60 percent of the figure shown below. Figures for States shown as "zero" indicate that all records were tabulated and thus data are not subject to sampling variability.

Table 1-7. Marriage Rates by Previous Marital Status and Age of Bride and Groom: Marriage-Registration Area, 1973

[Based on sample data. Rates per 1,000 population in specified group. Rates for all marriages are based on unmarried population, those for first marriages are based on single population, and those for all remarriages are based on widowed and divorced population. Figures for widowed and divorced, but not for all remarriages, exclude data for Michigan, Ohio, and South Carolina. Sampling Variability of the Divorce Statistics

In the tables which present statistics based on data from probability samples of divorce records, small frequencies have high sampling variability, which limits their usefulness. The sampling errors are shown in table 4-8 in the Technical Appendix. It is suggested that any number smaller than those shown below be interpreted simply as "small" rather than as any more precise value. The true number would very probably be within 60 percent of the figure shown below. Figures for States shown as "zero" indicate that all records were tabulated and thus data are not subject to sampling variability.

NOTES

Reporting areas

Marriage data are shown for both Puerto Rico and the Virgin Islands. Divorce totals are shown for both Puerto Rico and the Virgin Islands and detailed divorce statistics for the Virgin Islands only.

Geographic classification

Data are shown by place of occurrence. Totals are shown for the local areas St. Croix Island and St. Johns and St. Thomas Islands (the latter two combined) in the Virgin Islands and for the primary geographic subdivisions, "municipios," in Puerto Rico. Courts empowered to grant divorces are located only in a few municipios in Puerto Rico; residents of other municipios obtain divorces in these courts.

Race and color

For 1973, brides and grooms are not shown by color for either Puerto Rico or the Virgin Islands. Husbands and wives divorced in 1973 are classified as white or All other for the Virgin Islands.

Section 4—the Technical Appendix—includes information about the sample specifications, sampling errors, and completeness of reporting for these statistics from Puerto Rico and the Virgin Islands.

SECTION 4 - TECHNICAL APPENDIX

SOURCES OF DATA

Marriage and divorce statistics currently are based on information from three sources: (1) Complete counts of events obtained from all States, (2) samples of marriage and divorce certificates from States meeting certain reporting criteria, and (3) precoded machine readable data for all marriages occurring in Florida.

State and local officials annually provide complete counts of marriages and divorces by county of occurrence and marriages by month of occurrence. From these counts, marriage and divorce totals are derived and rates are computed for each State, geographic division, region, and the United States. For marriages a total is also derived for the marriage-registration area (MRA).

Sample records, or all records in the States with small numbers of events, are selected from microfilm copies of the original certificates received from the registration offices of States and areas comprising the marriage-registration area, except for Florida, and States in the divorce-registration area (DRA). The statistical information on these records, including data on the characteristics of marriages and divorces and of the persons involved in them, is edited, classified, transferred to tape for computer processing, and tabulated in the National Center for Health Statistics (NCHS). There is one exception to this procedure. For 1972 and 1973 Florida submitted precoded machine-readable marriage data through the Federal-State-Local Cooperative Health Statistics System for all marriages occurring in the State. The marriage totals for the MRA and each participating State derived from sample data differ slightly from the totals obtained from the complete count described above. The two published divorce totals for each State in the DRA also vary slightly. Only one total for the DRA, based on sample data, is published.

Marriage and divorce statistics for the United States and for the registration areas are limited to events occurring during the year and registered within the specified area. Tabulations for States and other areas are by place of occurrence and include events occurring to nonresidents. Marriages or divorces of members of the Armed Forces or other U.S. nationals that occur outside the United States are excluded. *United States* refers to the 50 States and the District of Columbia. Alaska has been included in the U.S. tabulations since 1959 and Hawaii, since 1960. Data

for Puerto Rico and the Virgin Islands were omitted in 1972, but were reinstated in 1973. Data for these areas were processed separately from the rest of the MRA and DRA, and appear in Section 3 of this volume.

Sources of marriage and divorce data since 1867 are shown in table 4-1; a description of these sources can be found in Section 7, Volume III, *Vital Statistics of the United States, 1960*.

Registration areas

Registration areas for the collection of marriage and divorce statistics were established in 1957 and 1958, respectively. The registration areas include States with adequate programs for collecting marriage and divorce statistics. Criteria for participation in the registration areas are:

1. A central file of marriage or divorce records.
2. A statistical report form conforming closely in content to the Standard Certificate of Marriage (figure 4-1) or Standard Certificate of Absolute Divorce or Annulment (figure 4-2).
3. Regular reporting to the State office by all local areas in which marriages or divorces are recorded.
4. Tests for completeness and accuracy of marriage or divorce registration carried out in cooperation with NCHS.

In 1973 the MRA (figure 4-3) comprised 41 States, the District of Columbia, Puerto Rico, and the Virgin Islands. The DRA (figure 4-4) included 29 States and the Virgin Islands. Table 4-2 shows when States and independent registration areas established central files and when they were admitted to the MRA and DRA.

In the statistical tabulations in this volume *Marriage-registration area* refers only to the 41 States and the District of Columbia. *Divorce-registration area* refers to the 29 States. Marriages in the MRA accounted for 81 percent of all marriages in the United States in 1973 and divorces in the DRA accounted for 59 percent of all divorces.

Service, serve as the principal means of getting comparable data from documents used to collect information on marriages and divorces in the United States. These model reporting forms, prepared in close collaboration with the Public Health Conference on Records and Statistics, were first recommended to the States in 1954 for adoption January 1, 1955, and stood without revision through 1967.

Revised standard certificates were recommended to the States for use beginning January 1, 1968. New items added to the marriage certificate were education of bride and groom, date last marriage ended if previously married, and identification of the officiant

as religious or civil. New items added to the divorce certificate were approximate date couple separated, education of husband and wife, name of attorney for plaintiff, number of previous marriages ended by death or by divorce or annulment, and total number of living children. The items "usual occupation" and "kind of business or industry" were dropped from the marriage and divorce standard records.

Each State and independent registration area determines the form and content of its vital records. Consequently the records vary in certain details. Although modified in each State as required by particular needs or by special provisions of the State vital

statistics law, the marriage and divorce certificates of most States in the MRA and DRA conform closely to the standard certificates.

Table 4-3 lists items on the Standard Certificate of Marriage and shows which States had the items on their forms in 1973. Table 4-4 shows the same information for the Standard Certificate of Absolute Divorce or Annulment.

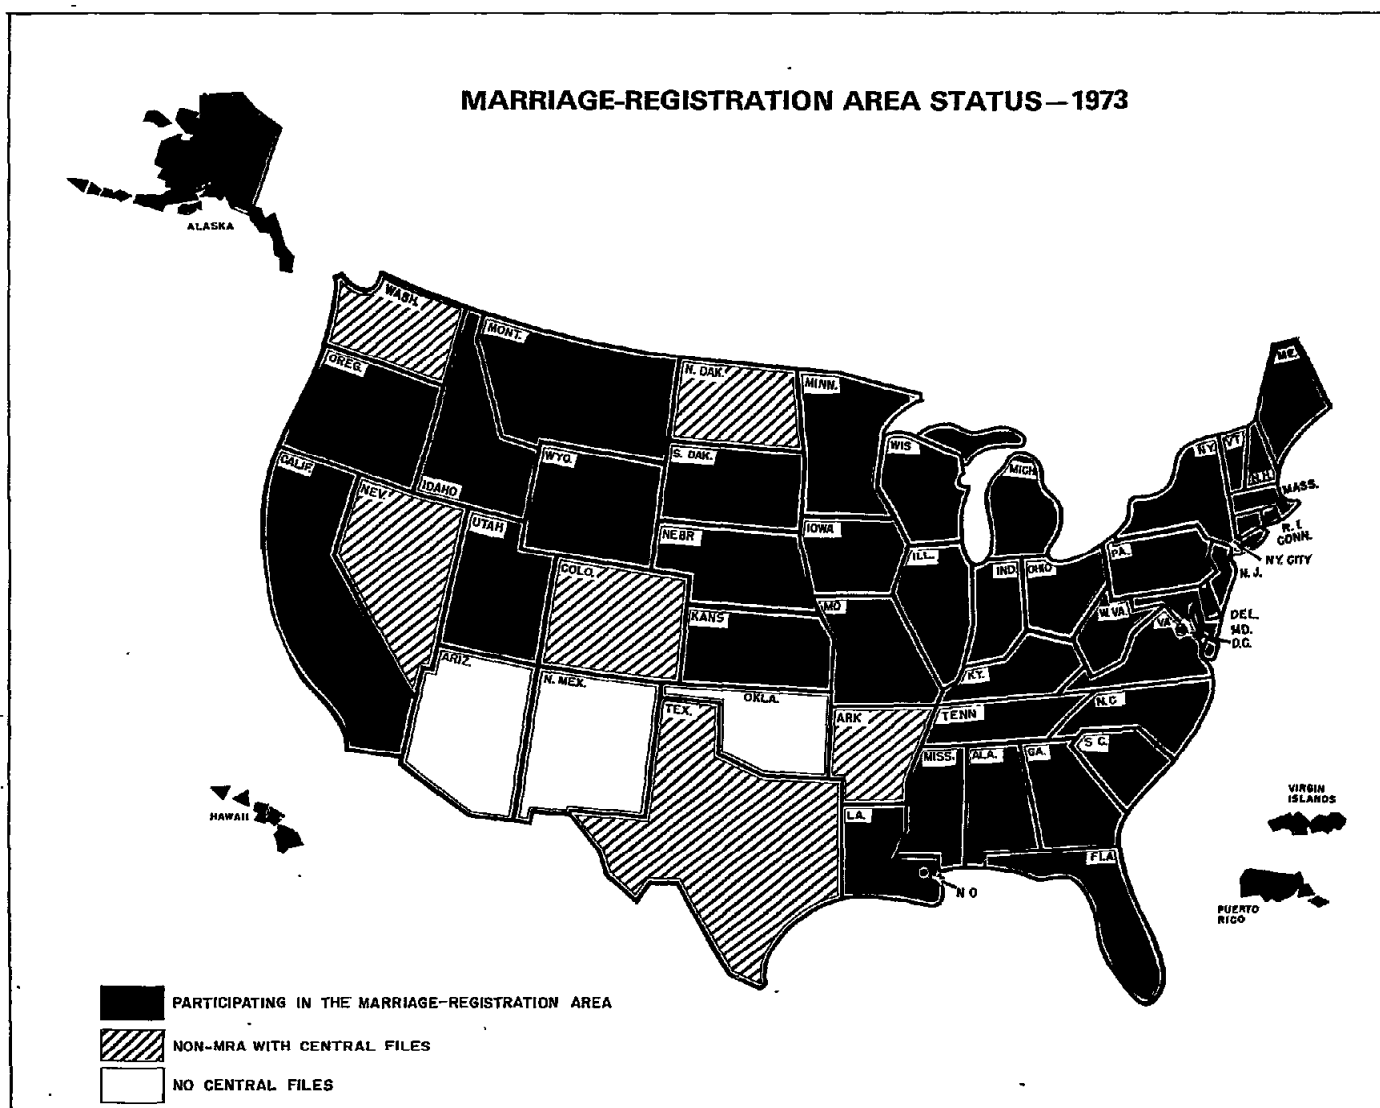

Nationwide counts

In 1973 the total counts of marriages by State and county were furnished from central files of marri-

age records for the 47 States maintaining them and for the District of Columbia. Counts for the five boroughs of the city of New York were supplied by the registration officials of Manhattan. In the areas without central files the counts were obtained from surveys conducted by State officials and NCHS. State officials reported for Arizona and Oklahoma. NCHS obtained county totals directly from county officials in New Mexico.

Total counts of marriages performed were requested from each registration official; however, all but two counties in Arizona and all of the counties in New Mexico reported the number of marriage licenses

FIGURE 4-3

issued. Registration officials reported marriages performed for the other 48 States and the District of Columbia. The number of marriage licenses issued is usually 1 or 2 percent greater than the number of marriages performed. (See page 2-1, Section 2, Volume I *Vital Statistics of the United States, 1959*.)

Total counts of divorces and annulments by State and county included decrees of marriage dissolution newly introduced in many States. These counts were furnished from central files of the 46 States maintaining them and from the District of Columbia. Although Louisiana maintains central files, counts for some parishes of Louisiana were obtained by NCHS directly from local officials. For two of the four States without central files of divorce records—

Arizona and Oklahoma—State officials conducted surveys to obtain county totals. NCHS obtained county totals directly from local officials in Indiana and New Mexico.

Divorces and annulments were not reported for one county or more in the following States: Arkansas (8), Indiana (23), Louisiana (7), and New Mexico (5). The national total of divorces and annulments includes estimates for these counties. The estimates prepared by NCHS assume that the rate in nonreporting areas of the State was the same as that observed for the reporting areas. The number of divorces for Tulsa County, Oklahoma, is based on the number of petitions filed, rather than on the divorce decrees granted.

ume when a sufficient number of the States in the registration areas have adopted an item and report it with a level of completeness that permits publication of the data for a group of States.

Most of the items tabulated for marriages in 1973 were on the certificates of nearly all the States in the MRA. Items on age at marriage or date of birth and State of residence were included by every State, and were well reported.

Information about previous marriages of the bride and groom is obtained from two items: Number of this marriage and previous marital status. For the District of Columbia and the 35 States that requested both items on their marriage certificates, first marriages and remarriages could be identified if either item was stated. Idaho, Maryland, and Oregon requested only the item on previous marital status. For these States the number of not stated cases for the missing item (number of this marriage) was reduced by the number of cases assumed to be first marriages because previous marital status was stated as single. Michigan, Ohio, and South Carolina requested only "number of times previously married." Not stated cases for the missing item (previous marital status) were reduced by the number of persons assumed to be single because they had been previously married "0" times.

Race is poorly reported on marriage certificates. The item appears on the forms of all States except California, Maryland, Massachusetts, Michigan, New York, and Ohio. Overall, race or color of bride and groom was not stated for about 622,000, or 34 percent, of the 1,846,501 marriages from the MRA.

Some of the items that appear on the divorce certificate were not coded and tabulated in 1973: Residence of husband, residence of wife, plaintiff, person to whom decree was granted, and legal grounds for decree.

Tables 4-3, 4-4, 4-9, and 4-10 show which items appear on the records of the registration States and how well they are reported by each State.

Marriages and marriage rates with seasonal adjustments

For all years appearing in table 1-4 the number of marriages and the marriage rates have been adjusted for large seasonal fluctuations and for the effect of the number of Saturdays and Fridays in each month. Beginning in 1970 the adjustments for Lent were discontinued because of the lessening influence of Lent on marriages. Most religious denominations have relaxed or abolished their rules against marriage during that period.

SAMPLE DESIGN

Obtaining the records

Each year the States participating in the MRA and the DRA prepare microfilm copies of their records, which are purchased by NCHS. Further processing, including sample selection, code punching, verification, and tabulation, is carried out by NCHS.

In conjunction with the recently established Federal-State-Local Cooperative Health Statistics System, Florida began in 1972 to submit precoded machine readable marriage data to NCHS. Not only was processed information submitted rather than the unprocessed microfilm certificate copies, but also the data were submitted on a 100-percent basis rather than the 10-percent sample that had been used through 1971.

For marriages the records refer to all marriages performed in 1973 within the 41 MRA States, the District of Columbia, Puerto Rico, and the Virgin Islands. For divorces the records refer to all decrees of absolute divorce, dissolution of marriage, and annulment that were granted during 1973 within the 29 DRA States and the Virgin Islands.

Interlocutory divorce decrees or decrees "nisi" (which grant that the divorce take permanent effect at a specific time in the future if the couple does not reconcile in the meantime) are included among the records of the States that grant them, usually for the year in which they were granted.

Sampling marriage and divorce records for States in the registration area was initiated in 1960. For earlier years data on characteristics had been compiled from predesigned tables submitted by the States.

Sampling procedures

The marriage sample was designed to yield estimates of State totals as well as frequency distributions. These estimates were made for the total MRA and each State in the MRA. A sampling rate was designated for each of the MRA States so that the selected sample for it would consist of at least 2,500 records. Five different sampling rates were used: All records, 1/2, 1/5, 1/10, and 1/20. The overall ratio for the MRA in 1973 was about 1/6.

Sampling procedures for the divorce sample parallel those for the marriage sample. A sampling rate was selected so that the sample for each DRA State would contain at least 1,000 records. Four different sampling rates were used: All records, 1/2, 1/5, and 1/10. Overall about 1/5 of the records were selected for the DRA sample in 1973.

The sampling rates, number of events, and sample cases by State for 1973 are shown in tables 4-5 (marriages) and 4-7 (divorces).

ESTIMATING PROCEDURES

Area totals

The figures obtained from complete counts of events furnished by the State and local offices differ slightly from the estimated totals based on sample data. When possible, major differences between the totals estimated from the sample and those based on independent counts for each reporting State are reconciled before the sample data are weighted and tabulated.

The sample estimate of marriages in the MRA differed from the complete count by 0.01 percent. It differed by less than 1 percent in 37 States, by less than 3 percent in four areas, and by 4.2 percent in Indiana.

The sample estimate of divorces in the DRA differed from the complete count by 2.9 percent. The difference was less than 1 percent in 19 States and 1-5 percent in 9 States. Because records were not submitted for divorces occurring in Wayne County, the sample estimate of divorces for Michigan was 34.0 percent below the final count.

Frequencies

Procedures for estimated frequency distributions for various characteristics were similar for the marriage and divorce samples. Frequencies were estimated in two steps.

1. Each sample case was assigned a weight which was the reciprocal of the sampling ratio used to select the case. If a marriage record was selected from a State with a sampling ratio of 1/10, that record was assigned a weight of 10; if 100 percent of the records were processed from a State, each such record was assigned a weight of 1.
2. Tabulated counts consisted of summing the records multiplied by their respective weights. Thus each frequency distribution such as age at marriage of first-married brides is a sum of the weighted sample cases included.

The weights for all sample records are identical within each State. However, as shown in tables 4-5 and 4-7, the weights vary among the registration States from 1 to 20 for marriage records and from 1 to 10 for divorce records. Therefore for the MRA and

DRA, any two approximately equal frequencies may have different sampling errors, varying with the proportion of cases from each stratum included in the estimate.

Percents and rates

Percents shown in the tables appearing in Sections 1 and 2 were computed from data excluding numbers of not stated cases. Rates appearing in Sections 1, 2, and 3 were based on population estimates developed by the U.S. Bureau of the Census (tables 4-11 through 4-14). Rates for 1940, 1950, 1960, and 1970 are based on the population enumerated as of April 1 in the censuses of those years. Rates for all other years are based on the estimated midyear (July 1) population for the respective years. Rates are based on population estimates including Armed Forces stationed in the United States but excluding Armed Forces abroad, except divorce rates for 1941-46 which are based on populations including Armed Forces abroad.

Allocation

On the marriage records, values were allocated for ages of bride and groom and date of marriage. These items have been reported with 99 percent or more completeness since 1960. Because States in the DRA vary radically in the completeness with which items are reported on the divorce records, no allocations were made prior to tabulation of the divorce data.

Children involved in divorces

To obtain national estimates for 1970 through 1973, the average number of children per decree for the DRA was multiplied by the national divorce total. From 1965 to 1969 the average number of children per decree was computed for the 16 States that had reported children with a satisfactory degree of completeness in 1965 (Alaska, Hawaii, Idaho, Iowa, Kansas, Michigan, Missouri, Montana, Nebraska, Ohio, Oregon, South Dakota, Tennessee, Virginia, Wisconsin, and Wyoming) and the national divorce total was multiplied by this average. This method was also used to revise figures for the years 1961-64 originally estimated by using a different method. Consequently data for 1961-64 shown in table 2-9 differ from figures appearing in Volume III *Vital Statistics of the United States* prior to the 1965 issue. In 1960 the estimate was based on sample data for the United States. For earlier years total counts from States reporting the number of children were used to esti-

mate the children involved in divorce for the United States.

SAMPLING ERRORS

Statistics for States where all records were used have no sampling error. For other States each statistic has a sampling error (or standard error) denoted by $\hat{\sigma}(x)$. The sampling error is primarily a measure of variation that occurs by chance because a sample of records is surveyed rather than the entire population. The sampling error can be computed because within each State or registration area the probability that a record will be chosen for the sample is known (either all records, 1/2, 1/5, 1/10, or 1/20, as shown in table 4-5). For about 68 percent of all possible samples of equal size the estimate from the sample would differ from the value obtained from a complete count by less than the standard error. For about 95 percent of all samples the difference would be less than twice the standard error.

Sampling errors are shown in table 4-6 for marriages and table 4-8 for divorces. To facilitate comparisons among registration States with widely varying totals of marriages or divorces, the sampling errors for the registration areas and participating States are shown for frequencies expressed as percents of State or of registration area totals. For example, table 1-17 shows 192,577 brides under 18 years of age in the MRA for 1973. This estimated frequency is about 10 percent of all brides in the MRA. In table 4-6 under the column "10 or 90" in the row for the total MRA we find the sampling error 1,412. Thus, chances are about 68 out of 100 that the actual number of marriages to brides under 18 years of age is within one standard error of the estimate from this particular sample ($192,577 \pm 1,412$, or between 191,165 and 193,989). The interval from 191,165 to 193,989 is called a 68-percent confidence interval for the actual number of brides under 18 years of age. Estimated sampling errors for individual registration areas can be calculated from the formula

$$\hat{\sigma}(x_{ij}) = \sqrt{\frac{N_i(N_i - n_i) p_{ij} q_{ij}}{n_i - 1}}$$

where

i = a State or registration area

j = a subclass, such as an age group of brides

N_i = the final count of events reported by State i (table 1-6)

n_i = the number of sample records in State i (table 4-5)

p_{ij} = estimated proportion of all cases with the characteristics j to be studied for State i (spread margin of table 4-6 as percent under "1 or 99," "2 or 98," "3 or 97," etc.)

$q_{ij} = 1 - p_{ij}$

$x_{ij} = N_i p_{ij}$, the estimated frequency of the characteristics under study.

In this formula we see that when the number of sample records, n_i , is the same as the total marriages, N_i , the numerator becomes zero and there is no sampling error for States that have all their records processed. We also see that because the values of p_{ij} and q_{ij} are complementary, their product ($p_{ij} q_{ij}$) remains the same if their values are reversed. For instance, the estimated sampling error for an estimate of 5 percent is the same as the sampling error for 95 percent. Therefore the sampling error for both values is listed in one column in table 4-6 under the heading "5 or 95."

For example, to calculate the sampling error for previously widowed Alabama brides

$N_i = 47,997$, the final count of Alabama marriages (table 1-6)

$n_i = 4,797$, the number of sample records for Alabama (table 4-5)

$x_{ij} = 2,420$, the estimated frequency of previously widowed Alabama brides (table 1-26)

p_{ij} = the number previously widowed expressed as a percent of all marriages: $2,420/47,997 = .05$ or 5 percent

$q_{ij} = 1 - p_{ij} = .95$ or 95 percent

and

$$\hat{\sigma}(2,420) = \sqrt{\frac{47,997(43,200)(.05)(.95)}{4,796}} = 143$$

So, the chances are 68 out of 100 that the actual number of previously widowed Alabama brides is between 2,277 and 2,563 ($2,420 \pm 143$).

The estimated sampling error for the MRA can be computed from the formula

$$\hat{\sigma}(x_j) = \sqrt{\left(\sum_{k=1}^{42} \frac{N_k(N_k - n_k)}{n_k - 1} \right) p_{kj} q_{kj}}$$

where:

42 refers to the number of States in the MRA and the District of Columbia

N_k = the final count of events reported by an MRA State

n_k = the number of sample records in the same State

p_{kj} = the estimated percent of all cases with the characteristics under consideration

$q_{kj} = 1 - p_{kj}$

Using the same formula, sampling errors for the DRA shown in table 4-8 were computed by summing over the 29 States in the DRA.

Many of the tables in this volume show percent distributions rather than frequencies. The sampling error for such a percent can be computed by dividing the sampling error found in table 4-6 by the estimated total number of events for the area. For example, table 1-10 shows that 5 percent of all Maryland brides were previously widowed. In table 4-6 under the spread margin "5 or 95" the Maryland sampling error is 144. Divide 144 by 47,930, the estimated number of marriages in Maryland as shown in the stub margin of the same table. The result is 0.3 percent, the sampling error for an estimated 5 percent of 1973 Maryland marriages. Thus, chances are about 68 out of 100 that the actual percent of previously widowed Maryland brides is 5.0 percent \pm 0.3, or between 4.7 and 5.3 percent.

The following formula is used to compute a sampling error for the proportion of events in a subclass of a subgroup, where the number of events in the subgroup is also subject to sampling error:

$$\hat{\sigma}(x/y) = 1/y \sqrt{\hat{\sigma}^2(x) - (x/y)^2 \hat{\sigma}^2(y)}$$

where:

y = the estimated frequency of the subgroup

x = the estimated frequency of the subclass of the subgroup

$\hat{\sigma}(y)$ = the sampling error of y from table 4-6

$\hat{\sigma}(x)$ = the sampling error of x from table 4-6

To illustrate, if we wanted the sampling error for the proportion of all previously married Ohio brides who were 20-24 years of age, let

$x = 5,300$ previously married Ohio brides who were 20-24 years of age (table 1-19)

$y = 26,300$ Ohio brides who had been previously married

$x/y = .2015$

N = all marriages in Ohio, 99,524

$x/N = .05$, the proportion of previously married Ohio brides who were 20-24 years of age

$y/N = .26$, the proportion of Ohio brides who were previously married

$\hat{\sigma}(x) = \hat{\sigma}(5,300) = 300$ from table 4-6 under "5 or 95"

$\hat{\sigma}(y) = \hat{\sigma}(26,300) = 595$ from table 4-6 under "25 or 75"

and

$$\hat{\sigma}(x/y) = 1/26,300 \sqrt{(300)^2 - (.20)^2 (595)^2} = .0105$$

or 1.05 percent

So, chances are 68 out of 100 that the actual proportion of previously married Ohio brides who were 20-24 years of age was $.2015 \pm .0105$, or between 19.10 percent and 21.20 percent.

The significance of the difference between two proportions may be determined by the following formula:

$$\frac{(x_1/y_1) - (x_2/y_2)}{\sqrt{\hat{\sigma}^2(x_1/y_1) + \hat{\sigma}^2(x_2/y_2)}}$$

where the x 's and y 's represent the same subgroups as above, but of two populations, and where the denominator, under the square root sign, represents the sampling error of the difference between the proportions x_1/y_1 and x_2/y_2 shown in the numerator of the formula. If the above ratio is 2 or larger, the difference between proportions is considered to be significant at the .95 level of confidence.

For example, 20.15 percent of previously married brides in Ohio were 20-24 years old with a sampling error of 1.05 percent. Using the same procedure for previously married grooms in Ohio, .0997, or 9.97 percent, were 20-24 years old with a sampling error of .0084 or .84 percent. By the above formula:

$$\frac{.2015 - .0997}{\sqrt{(.0105)^2 + (.0084)^2}} = \frac{.1018}{.0135} = 7.6$$

Since the difference in proportion divided by the sampling error is larger than 2, this difference of 10.18 percentage points between brides and grooms is expected to occur by chance no more than once in 20 times; the difference is significant.

NONSAMPLING ERRORS

In addition to the sampling errors described above, there are several other sources of variation that are little affected by the size or design of the sample.

Incomplete reporting

Nonresponse errors in marriage and divorce data arise from three sources: (1) The item is not on the certificate of a particular reporting area. For example, the item "color" was removed from the 1971 revision of the Massachusetts marriage record; (2) sometimes when a State revises its form to include additional items, copies of the old form are still used extensively by registration offices until a supply of the old version is exhausted; or (3) although the item may be on the form, there may be no response, or the response may be illegible or unusable. Items on some forms are badly worded and do not elicit responses sufficiently precise to be classified.

Items not answered for any of these three reasons are tabulated as "not stated." Tables 4-9 and 4-10 show the proportions of not stated cases for specified characteristics of marriages and divorces for 1973. Footnotes to entries identify the specific State where an item was not on the certificate form (not reportable). A major proportion of the not stated cases for marriages were due to the absence of items on some of the reporting forms (not reportable). In contrast, the majority of not stated items on records of divorce or annulment arose from unanswered items (not completed). Personal information typically has been less completely reported on the divorce records than information about the marriage and the decree.

Other sources of error

Inconsistent responses.—Occasionally, for both marriages and divorces, the responses to related items are inconsistent. For example, when age and date of

birth are both reported, they may not agree, or previous marital status may not be consistent with the number of times married or number of this marriage. These differences are arbitrarily reconciled before tabulation.

Ambiguous wording of items.—Some of the items are worded so that they do not yield information easily classified in standardized categories. This often leads to errors in classification, most frequently of geographic place names (residence, place of marriage, and place of birth) and of data about previous marriages.

Microfilm errors.—Errors in the arrangement of the records received on microfilm in NCHS sometimes occur when numbers on the records are out of sequence, missing, or duplicated, or when records that are not part of the universe being sampled are erroneously included in the file.

Processing errors.—All sample coding was verified 100 percent; data already on computer tape were edited for impossible codes and for inconsistencies. Instances of impossible codes and inconsistencies in information about previous marriages were rechecked to the records.

In general, for most of the data available from 1960 onward, the completeness and year-to-year consistency are evidence of the basic reliability and coverage of the marriage- and divorce-registration systems.
