COOPERATION OF THE BUREAU OF THE CENSUS

Under the legislation establishing the National Health Survey, the Public Health Service is authorized to use, insofar as possible, the services or facilities of other Federal, State, or private agencies.

In accordance with specifications established by the National Health Survey, the Bureau of the Census, under a contractual arrangement, participates in most aspects of survey planning, selects the sample, collects the data, and carries out certain parts of the statistical processing.

FAMILY INCOME IN RELATION TO SELECTED HEALTH CHARACTERISTICS

INTRODUCTION

Sociologists, economists, and statisticians have often stated that the behavior of the American people is closely related to their economic well-being. Doctors, nutritionists, and other health workers have similarly noted differences in the rate of disability, disease, and injury and differences in the use of community health services among people in various income brackets. In the relationship between low income and ill health, it is difficult to determine which is the cause and which is the effect. Undoubtedly the effects are reciprocal, that is, the amount of family income may affect nutrition, living conditions, health, and the use of health services; similarly, malnutrition, poor living conditions, and illness

may result in lower income because they adversely affect a person's ability to obtain employment or to succeed in business.

To illustrate the relationship between family income and health, three types of health characteristics were selected for inclusion in this report: The first, disability data which measure the overall effects of chronic and acute illness on the person and his family; the second, persons-injured data which gauge the impact of accidents and other unforeseen events on the individual; and third, hospital discharge data which provide a measure of the effect of illness on the utilization of health facilities.

SOURCE OF DATA

The information contained in this report was obtained from nationwide household interviews conducted by the U.S. National Health Survey, National Center for Health Statistics. This report is divided into three sections covering three data collection periods: disability days, July 1960-June 1961; hospital discharges, July 1958-

June 1960; and persons injured, July 1959-June 1961.

Interviews were conducted in approximately 38,000 households comprising 125,000 persons during each year. Therefore, information on hospital discharges and persons injured is based on interviews in about 76,000 households comprising 250,000 persons, and disability days data on about 38,000 households comprising 125,000 persons. The survey is continuous, each week covering a representative sample of the civilian, noninstitutional population of the United States.

This report was prepared by Robert R. Fuchsberg of the U.S. National Health Survey staff.

The presence of illness or injury among household members was determined by responses to "illness-recall" questions 11-17 on the questionnaire (see facsimile shown in Appendix III). For each illness or injury named in response to these questions, more detailed information was obtained about the condition (table I of the questionnaire) including the number of days of restricted activity, bed disability, and time lost from work or school associated with it during the 2-week period prior to the week of interview.

For each sample person, the number of days of each type of disability is determined by summing the days of disability due to each condition during the 2-week reference period. In this summing process, however, a disability day which resulted from more than one condition is counted only once as a day of disability for the person involved.

When responses to questions in table I indicated that an injury had occurred, the interviewer asked the additional questions shown in table A of the questionnaire to obtain more detailed information relating to the accident and the injury. To be included in the statistics, an acute injury condition must have been medically attended or caused at least 1 day of activity restriction. Minor injuries which did not require medical attention or restricted activity were excluded from the data. Annual estimates of the number of persons injured and annual estimates of days of disability due to injury are derived from the total number of persons injured and the total number of days of disability experienced during the 2-week period prior to the week of interview. All such days of disability due to injury were included, even if the injury causing the disability occurred prior to the 2-week period.

Questions 20 and 21 and table II of the questionnaire are used to obtain information about the hospitalization experience of household members during the 12 months prior to the week of interview. Methodological studies conducted by the National Health Survey relating to the reporting of hospital experiences in interview surveys indicate that information reported for the most recent 6 months of a 1-year recall period tends to be more accurate than that reported for the earlier part of the reference period. Therefore, in processing the data, the hospital experience

reported for individuals during the 6-month period immediately preceding the week of interview was adjusted to serve as a basis for the estimated annual number of completed hospitalizations. These hospital discharge data include estimates of the number of hospital discharges and days for which some portion of the bill was paid by insurance. For approximately 32 percent of the hospital discharges, it was reported that no part of the bill was paid for by insurance. It should be noted that this does not mean that for almost one-third of the hospital discharges these individuals had to pay for the entire hospital bill out of their own or out of family funds. Sources other than insurance and family funds are sometimes used to help finance the cost of hospital care. Health agencies, charitable organizations, and Federal, State, and local governments spend large sums to help finance the cost of hospital services.

It should be emphasized that there are some factors in the survey method which tend to produce differences in the estimates shown as contrasted with statistics based on record sources. Of particular importance is the fact that the survey data refer only to persons who were alive at the time of interview. While the exclusion of information regarding the disability, injury, and hospital experience of persons who died tends to reduce all of these estimates, it particularly affects the data relating to the number of hospital discharges and days of hospitalization for older persons.

More detailed reports covering data related to each of the selected health characteristics discussed in this report have been prepared by the National Health Survey in *Health Statistics*, Series B, and are available for distribution. Recent reports dealing with these topics include the following:

No. 29. Disability days, United States, July 1959-June 1960

No. 30. Proportion of Hospital Bill Paid by Insurance, Patients Discharged from Short-Stay Hospitals, United States, July 1958-June 1960

No. 32. Hospital Discharges and Length of Stay: Short-Stay Hospitals, United States, 1958-1960

No. 37. Persons Injured by Detailed Type and Class of Accident, United States, July 1959-June 1961

No. 40. Disability Days Due to Injury, United States, July 1959-June 1961

Included in Appendix I of this report is a brief description of the survey design and methods used in estimation. Since all of the data included in this report are estimates based on a sample of the population rather than on the entire population, they are subject to sampling errors. While the sampling errors for most of the estimates are of relatively low magnitude, the sam-

pling error may be high where an estimated number or the numerator or the denominator of a rate or percentage is small. Charts from which approximate sampling errors may be estimated and instructions for using the charts are also presented in Appendix I.

Definitions of the terms used in this report may be found in Appendix II. Since many of the terms have specialized meanings, it is suggested that the reader familiarize himself with these definitions. A facsimile of the health interview questionnaire used to record these data is presented as Appendix III.

DISABILITY DAYS JULY 1960-JUNE 1961

Illness or injury may result in one or several of the following types of disability: the condition may cause a person simply to restrict his usual activities; in addition, the condition may be serious enough to cause the person to stay in bed or in a hospital; and if restriction of activities or a stay in bed occurs on a day when the person would have been working or going to school, time lost from work or school will result. Days of restricted activity, days in bed, days lost from work, and days lost from school are all considered to be measures of disability. However, because the same disability day may be counted in each of several of these measures of disability, they are not additive.

Table A is a summary of the days of disability per person per year associated with illness or injury during the 12-month period ending June 1961. The income categories shown in this table are inversely correlated with days of disability; that is, as family income rises, the number of disability days per person declines. The restricted-activity rates vary considerably according to family income. People with family incomes under \$2,000 per year have a restricted-activity rate that is $2 \frac{1}{3}$ times as high as those with family incomes of \$7,000 or more—29.8 days per person per year as compared with 13.0 days. The other disability measures shown in table A followed the same pattern, but the variation in rates between the lowest and highest income groups

was less marked. Individuals whose family income was less than \$2,000 per year had $2 \frac{1}{4}$ times as many bed-disability days, $1 \frac{2}{3}$ times as many work-loss days, $1 \frac{1}{4}$ times as many hospital days, and $1 \frac{1}{10}$ times as many school-loss days as individuals with family incomes of \$7,000 or more. Persons in the other two income groups shown in table A—those with family incomes of \$2,000-\$3,999 and \$4,000-\$6,999—also reported rates of disability days inversely correlated with family income.

There are sharp differences in disability rates as reflected by the restricted activity, bed disability, and work loss of persons with family incomes under \$2,000 and those with family incomes from \$2,000-\$3,999. Persons in the lowest income group shown in table A experienced about 68 percent more restricted activity and bed disability and 36 percent more work loss than persons in the next higher income group. It appears that those in the lowest income group are a segment of the population which has serious health problems. The age distribution of the population by family income highlights the difference in the age composition of the population in the "under \$2,000" family income group with the population in each of the other income groups (table B). In the "under \$2,000" group, persons 65 years of age and over accounted for about 24 percent of the population. This older age group represented only 11 percent of the population in the \$2,000-

Table A. Number of disability days per person per year, by family income and sex:

Table B. Percent distribution of population, by age and family income: United States,
July 1960-June 1961

Age	Family income					
	All incomes	Under \$2,000	\$2,000-3,999	\$4,000-6,999	\$7,000+	Unknown
Percent distribution						
All ages-----	100.0	100.0	100.0	100.0	100.0	100.0
Under 15 years-----	32.1	24.8	32.0	36.5	31.5	26.2
15-24 years-----	13.2	14.6	14.7	12.3	12.7	13.9
25-44 years-----	25.5	15.2	21.9	29.3	29.1	22.0
45-64 years-----	20.4	21.5	20.3	17.7	22.4	25.0
65+ years-----	8.7	23.9	11.1	4.3	4.3	12.9

\$3,999 income group and merely 4 percent of the population in each of the other two (known) income groups. The extremely high proportion of older persons and low proportion of persons 25-44 and under 15 years of age among persons with family incomes "under \$2,000", as compared with persons in these age groups in each of the other income groups, is a further indication that the people in this income classification differ from those in the other income categories. However, the lowest income group has higher rates of restricted activity, bed disability, and work loss even when age is held constant. (See tables 1, 2, and 4.)

While considerably higher rates of restricted activity and bed disability were reported for females than for males, rates for hospital, work-loss, and school-loss days showed little variation by sex. Females averaged about 4 days more of restricted activity and 1 1/2 days more of bed

disability annually than males (tables 1 and 2). Although males and females each averaged 0.9 days of hospitalization during the year, in the lower income group the average number of hospital days for males exceeded that for females. In the two higher income groups, the situation was reversed with more time in the hospital reported for females (table 3).

Detailed tables 1-5 show both the number and rate for each of the disability measures by income, sex, and age. The rates for restricted activity, bed disability, and hospital days are based on the total population shown in table 6. Rates for days lost from school are based on the total school-age population 6-16 years. Work-loss rates, however, are based on only the currently employed population 17 years of age and older as shown in table 7.

Table 1. Number of restricted-activity days and number of restricted-activity days per person per year, by family income, sex, and age: United States, July 1960-June 1961

HOSPITAL DISCHARGES FROM SHORT-STAY HOSPITALS

JULY 1958-JUNE 1960

The relationship between family income and discharges from short-stay hospitals is not as clear cut as the relationship between family income and disability. Based on data gathered in interviews during the 2-year period July 1958-June 1960, the highest rate of hospital discharges (119.7 per 1,000 population) was reported by persons with annual family incomes of \$2,000-\$3,999. This group averaged 8.3 hospital days per discharge. Persons whose annual family income was under \$2,000 had a lower rate of discharges (114.1 per 1,000 population) than the aforementioned group, but a longer length of stay per discharge (11.4 days). Those with family incomes of \$4,000 or more reported lower rates of short-stay hospital discharges and fewer days per discharge than the lower income groups (tables 8, 9, and 10).

The greater use of hospital services by persons in the low income group is reflected in the higher discharge rates and longer length of hospital stays for persons with family incomes of less than \$4,000. These rates are associated with the high proportion of persons over 65 years of age and the low proportion of persons 25-44 years of age with family incomes under \$4,000 (table C).

The hospital discharge rate for females (140.9 per 1,000 population) was considerably higher than the corresponding rate for males (87.5). This rate difference was due to the markedly higher rates for females during the childbearing years (table D). A discharge rate of 231.4 per 1,000 persons was reported for females 15-24 years of age as compared with a rate of 68.3 per 1,000 for males. A similar rate difference by sex was recorded for persons in the 25-34 year age group. Females in the 35-44 year age group had about twice as many hospital discharges as males. Deliveries and complications of pregnancy and other conditions associated with childbearing have a considerable impact on female discharge rates for the age groups 15-34 and 35-44. Male hospitalization rates follow a fairly consistent pattern, increasing with age. Since high hospitalization rates are associated with older persons

and with females of the childbearing ages, the average rate for each income group largely depends on the population composition of each income group.

Table C indicates that while the proportion of older persons in the under \$2,000 income group is very high, the proportion of women of the childbearing ages is extremely low. Families in the next income group (\$2,000-\$3,999) have a smaller proportion of older persons but a considerably higher proportion of women of childbearing age. Each of the higher income groups has a high proportion of females of childbearing age but an extremely low proportion of elderly persons. Figures shown in this report relating to discharges from short-stay hospitals are based on estimates of the average annual number of hospital discharges and the number of hospital days for patients discharged, but exclude discharges and days for persons who died during the year prior to the interview. The exclusion of the hospital experience for persons who died would be expected to have an appreciable effect on the data for the older age groups, but relatively little effect on data for the younger groups.

There are a number of economic factors in addition to income which influence the rates of hospitalization. Persons who are unable to pay for their hospitalization are often able to obtain hospital services either free or by making a token payment. Some of the people in low income families and a large proportion of the people in middle and high income families have insurance which pays part or all of the hospital costs. Of the 20 million hospital discharges per year, 13 1/3 million or 67 percent involved insurance payment for some or all of the hospital bill. The proportion of persons with hospital insurance that covered all or part of their hospital bill ranged from 39 percent for persons with family incomes under \$2,000 to 80 percent for those with family incomes of \$7,000 or more (table E).

Age is also a significant factor in hospital insurance coverage. While three-fourths of the discharged patients 35-64 years of age had all or part of their hospital bill paid by insurance, only

about one-half of the patients in the 65 and over and the 15-24 age groups received any insurance payment to help meet their hospital bill. Table E presents the percent of discharges for which some or all of the hospital costs were paid by insurance by age and income group.

Note that the percentages shown in table E follow a fairly consistent pattern by age. Since the bulk of hospital insurance contracts provide family coverage, it is not surprising that the percentages for children under age 15 and those for all ages are about the same in each of the income groups. In the 15-24 year age group, the

major portion of the people are no longer covered by their parents' hospitalization policies, and some have not secured insurance of their own. There is, therefore, a marked drop in the percentages of discharges in which insurance helped pay the hospital costs for persons in this age group as compared with the percent with insurance payments for children under 15 years of age. The people in each succeeding age group have a higher proportion of their hospital discharges covered by insurance which pays part or all of their hospital costs. The one exception is the 65 years and over age group. In this group,

35-44 years-----	123.7	84.6	159.8
45-64 years-----	115.8	113.3	118.2
65+ years-----	145.6	165.0	129.6

NOTE: Estimates of discharges are based on the experience of members of the sampled households who were alive at the time of the family interview.

Table E. Percent of all patients discharged from short-stay hospitals, for whom insurance paid part or all of the hospital bill, by age and family income: United States, July 1958-June 1960

Age	Family income					
	All incomes	Under \$2,000	\$2,000-3,999	\$4,000-6,999	\$7,000+	Unknown
	Percent					
All ages-----	67.0	39.0	58.5	78.1	79.9	56.7
Under 15 years-----	71.0	32.5	58.5	79.8	79.5	69.3
15-24 years-----	53.8	29.3	44.8	68.1	70.3	40.3
25-34 years-----	69.3	31.1	59.7	78.9	80.3	47.6
35-44 years-----	76.5	40.7	64.4	83.6	86.8	66.2
45-64 years-----	75.0	49.5	70.9	83.6	87.5	66.8
65+ years-----	50.2	42.1	58.3	62.6	49.3	44.5

the percentage of hospital discharges with the cost wholly or partially covered by insurance is only 50.2. This is undoubtedly due to the fact that some hospitalization policies do not provide coverage for persons in this age group, and also because of the large proportion of retired persons who are no longer covered by insurance when they leave their last place of employment.

The highest percentage of discharges wholly or partially covered by insurance occurred in the group with family incomes of \$7,000 or more. In this group, persons 45-64 years of age report that insurance payments helped meet the cost of 87.5 percent of their hospitalizations. This proportion is even more striking when compared with the percentage for persons in the same income group who were over 65 years of age. This age group reported that only 49.3 percent of their hospitalizations in short-stay hospitals were covered to some extent by insurance.

The increase in the percentage of discharges that were totally or partially covered by insurance from 53.8 percent for the 15-24 year age group to 75.0 percent for the 45-64 year group and the

rather precipitous drop to 50.2 percent for the 65 years and over age group illustrates the fact that the hospitalization coverage for the older segment of the population is incomplete (table E).

AVERAGE LENGTH OF HOSPITAL STAY

Regardless of income level, persons with no insurance payment for their hospital bill had longer average length of hospital stays than those whose hospital costs were either fully or partially paid by insurance. Discharges involving no insurance payment averaged 1.8 days longer than discharges for which insurance paid all or part of the hospital costs (table 11). The discharges which were totally or partially covered by insurance accounted for 62 percent of all hospital days. When this proportion is examined by income group, it is seen that the lowest income group (persons with family incomes under \$2,000) received insurance payments to help meet the cost of hospital discharges which involved only 36 percent of the hospital days.

Table 8. Average annual number of patients discharged and number of patients discharged per 1,000 population per year, by family income, sex, and age: discharges from short-stay hospitals, United States, July 1958-June 1960

PERSONS INJURED BY CLASS OF ACCIDENT

JULY 1959-JUNE 1961

As shown in table 13 for the 2-year period ending June 30, 1961, about 45 million persons per year sustained injuries which required medical attention or caused restriction of usual activities for a day or more. This estimate of persons injured and the estimates of disability associated with these injuries are based on data gathered by the Health Interview Survey. About one person was injured each year among each four persons in the civilian, noninstitutional population of the United States. The annual rate was 255.2 persons injured per 1,000 population.

Since injury rates in general decline with age, the high proportion of older people in the "under \$2,000" group tends to lower the injury rate for this group. The rate for persons in this group was 229.5 persons injured per 1,000 population. An injury is included in these estimates only if it involved medical attention or caused the person to cut down on his usual activities for a day or more. The first of these criteria might tend to lower the rates for low income families since persons injured in these families would be less likely to seek medical care for minor injuries. As may be noted in figure 1, those in the low income group experienced the lowest rate of work injuries. Persons with annual family incomes under \$2,000 have a larger proportion of older persons, many of whom are no longer in the labor force. Consequently, this group is less subject to the risk of work accidents. Furthermore, because of age and physical condition, employed persons in this low income group are often employed at less hazardous occupations. Persons with family incomes of \$2,000-\$6,999 have the highest rate of persons injured in work accidents because more of these people are regularly employed at relatively unskilled or semi-skilled jobs. Persons in the highest income group—those with family incomes of \$7,000 or more—experienced considerably lower rates of injuries resulting from accidents while at work than persons in the lower income groups. The lower rates for this high income group is to be expected since the workers in this group include professional, supervisory, and highly skilled

personnel. It may be assumed that the risk of work injury is lower among persons in these occupational classes (table 14).

The highest reported rates for persons injured involved accidents which occurred in the home. Home accidents resulted in 106.5 persons injured per 1,000 population per year. By income group, these rates ranged within fairly narrow limits—from a rate of 98.3 per 1,000 persons with family incomes of less than \$2,000 per year to 111.1 for those with family incomes of \$2,000-\$3,999. Persons with family incomes of \$4,000 or more appear to have slightly higher rates of injury for accidents involving motor vehicles

Figure 1. Average annual number of persons injured per 1,000 population, by family income.

than those in the lower income groups. However, rate differences of the magnitude shown for motor vehicle accidents are not statistically significant. Information on the reliability of these estimates is given in Appendix I.

Rates for persons injured for males exceeded those for females in each class of accident except those occurring in or about the home. The rates for persons injured while at work present a rather striking sex difference—82.2 persons injured per 1,000 population for males as compared with 12.4 per 1,000 for females. This difference is to be expected since 51.6 percent of the male population is currently employed and only 24.9 percent of the female population is currently employed. Males have about twice as many chances as females of experiencing an accident while at work simply because a greater proportion of the male population is employed. When the population of currently employed persons is used to compute the rates for persons injured while at work, the rate for males is still about three times as high as that for females—159.3 per 1,000 and 49.7 per 1,000, respectively. This undoubtedly reflects the difference in the type of work done by males and that done by females.

BED-DISABILITY DAYS DUE TO INJURIES

For the 2-year period July 1959-June 1961, as shown in table 15, there was an annual average of 113,539,000 days of bed disability caused by injuries. For each 1,000 persons in the population, there was a yearly average of 644 days spent in bed as a result of an injury. Persons in the lowest income group experienced the highest rate of bed disability. In each of the successively higher family income groups, the rate of bed disability decreased. Since for wage earners who have prolonged periods of bed disability the family income may be affected by the extent of disability, it is not surprising to note this inverse association, but as has been noted earlier, it is not possible to state with assurance which is the cause and which is the effect.

Bed-disability rates for injuries varied directly with age. Among both males and females the rates of bed disability increased with age so

that the highest rates of bed disability caused by injury were recorded for persons over 65 years of age. For each 1,000 persons in this oldest age group, injuries were responsible for 1,471 days of bed disability annually. Since this aged group had the lowest rate of persons injured, it is apparent that elderly persons who are injured mend slowly and average more days of disability per accident. Furthermore, elderly persons are subject to higher rates of certain of the more disabling types of injuries. For example, fractures and dislocations occurred annually to about 48 of every 1,000 persons 65 years and older—a rate higher than for any other age group and twice as high as for persons 5-14 and 45-64 years of age.

For each of the classes of accidents shown in this publication, the rates of bed disability and income followed the pattern of the total for all classes. Because of the high proportion of older persons in the low income groups and the high rate of disability associated with injuries among these persons, the rate of disability due to injury was inversely related to the amount of family income. The rate of bed disability for the lowest income group (those with an annual family income under \$2,000) averaged about three times the rate for persons in the high income group (those with family incomes of \$7,000 or more) (table 15). Table 16 shows that the rate of bed-disability days for persons injured in motor vehicle accidents in low income families was 2.7 times the corresponding rate for persons in the high income group. Persons with family incomes under \$2,000 had 2.4 times as many accidents while at work, 3.2 times as many accidents at home, and 3.6 times as many other accidents as persons in the highest family income group.

WORK-LOSS DAYS

During the 2-year period July 1959-June 1961, a yearly average of 83.8 million work-loss days were experienced by currently employed persons because of injury (table 17). A day was considered as lost from work if the person would have been going to work at a job or business but instead lost the entire day because of injury. The rates for work-loss days shown in tables 17 and 18, are based on the currently em-

ployed population 17 years of age and over who reported that at some time during the 2-week period covered by the interview they either worked at or had a job or business.

Among each 1,000 of the currently employed persons shown in table 17, there was an average of 1,255 days lost from work each year due to injuries. The rates for both sexes and for males are consistent with the bed-disability figures. That is, as family income increases, work-loss day rates decrease. Work-loss rates for females deviate from this pattern. The highest work-loss rate for females was experienced by persons with \$4,000-\$6,999 family income; females in this income group experienced higher rates of work loss in each age group.

Work-loss rates for women were consistently lower than the corresponding rates for men in each of the income groups. Since the females experienced lower rates of injury, these lower rates of work loss associated with injuries might have been anticipated. Only in the 65 and over age group did the work-loss rates due to injury for females exceed those for males. This is similar to the pattern for persons injured and bed disability resulting from injury. The rates for each of these measures are higher for females than for males in the age group 65 years and over.

Work-loss days due to injuries averaged 83.8 million days annually during the 2-year period July 1959-June 1961. These 83.8 million

days represent 22.8 percent of the total of 367.2 million work-loss days per year. Thus, more than 1 of every 5 days lost from work due to illness or injury was caused by injury.

In examining the classes of accidents that gave rise to this absenteeism, attention should be given to the definitions of the categories. Note that the categories used in this report—(1) motor vehicles, (2) while at work, (3) home, and (4) other and unknown—do not appear to be mutually exclusive. That is, a person may be injured in a motor vehicle accident while at work. These categories, however, were made mutually exclusive by classifying accidents which could appropriately be included in more than one category by the following rule: "with the categories listed in the above sequence count the accident in the first category which is applicable." This set up a priority system so that all accidents involving a motor vehicle were included in the motor vehicle category. All accidents occurring while at work except those involving a motor vehicle were included in the while at work category. Similarly, all accidents occurring in or about the home except those involving a motor vehicle or those occurring while at work were included in the home category. All accidents not included in any of the previous groups were included in the other and unknown group. Figure 2 illustrates the numbers of work-loss days per 1,000 currently employed persons by sex, class of accident, and family income.

Figure 2. Average annual work-loss days due to injuries per 1,000 currently employed persons, by sex and family income.

APPENDIX I

TECHNICAL NOTES ON METHODS

Background of This Report

This report, Family Income in Relation to Selected Health Characteristics, is one of a series of statistical reports prepared by the U.S. National Health Survey. It is based on information collected in a continuing nationwide sample of households in the Health Interview Survey, a major aspect of the program.

The Health Interview Survey utilizes a questionnaire which, in addition to personal and demographic characteristics, obtains information on illness, injuries, chronic conditions and impairments, health insurance coverage, and other health topics. As data relating to each of these various broad topics are tabulated and analyzed, separate reports are issued which cover one or more of the specific topics. The present report includes data on three health characteristics: (1) disability days, (2) hospital discharges, and (3) persons injured. The disability-day information is based on the consolidated sample for 52 weeks of interviewing during the period July 1960-June 1961; hospital-discharge data is based on 104 weeks of interviewing during the period July 1958-June 1960; and the statistics on persons injured are also based on 104 weeks of interviewing but these are included in the period July 1959-June 1961.

The population covered by the sample for the Health Interview Survey is the civilian, noninstitutional population of the United States living at the time of the interview. The sample does not include members of the Armed Forces, U. S. nationals living in foreign countries, or crews of vessels. It should also be noted that the estimates shown do not represent a complete count because the disability, injury, and hospital-discharge experiences of some of the persons who died are not included. For disability days and persons injured, the estimates are undercounted to the extent that persons experienced days of disability or injuries during the 2-week-recall period but died prior to the interview. The data on hospital discharges from short-stay hospitals similarly underestimate the number of discharges since no adjustment has been made for household members who were hospitalized during the 6-month-recall period but who died prior to the time the household was interviewed.

Statistical Design of the Health Interview Survey

General plan.—The sampling plan of the survey follows a multistage probability design which permits a continuous sampling of the civilian population of the United States. The first stage of this design consists of drawing a sample of 500 from the 1,900 geographically defined primary sampling units (PSU's) into which the United States has been divided. A PSU is a county, a group of contiguous counties, or a standard metropolitan statistical area.

With no loss in general understanding, the remaining stages can be telescoped and treated in this discussion as an ultimate stage. Within PSU's, then, ultimate stage units called segments are defined, also geographically, in such a manner that each segment contains an expected six households in the sample. Each week a random sample of about 120 segments is drawn. In the approximately 700 households in those segments, household members are interviewed concerning factors related to health.

Since the household members interviewed each week are a representative sample of the population, samples for successive weeks can be combined into larger samples. Thus the design permits both continuous measurement of characteristics of high incidence or prevalence in the population, and through the larger consolidated samples, more detailed analysis of less common characteristics and smaller categories. The continuous collection has administrative and operational advantages as well as technical assets, since it permits field work to be handled with an experienced, stable staff.

Sample size and geographic detail.—In each 12-month period ending in June, the sample included approximately 125,000 persons from 38,000 households. Therefore data dealing with hospital discharges and persons injured which are based on a 2-year-sample include approximately 250,000 persons from 76,000 households. The over-all sample was designed in such a fashion that tabulations can be provided for each of the major geographic regions and for urban and rural sectors of the United States.

Collection of data.—The field operations for the household survey are performed by the Bureau of the Census under specifications established by the Public Health Service. In accordance with these specifications the Bureau of the Census designs and selects the sample; conducts the field interviewing, acting as the collecting agent for the Public Health Service; and edits and codes the questionnaires. Tabulations are prepared by the Public Health Service using the Bureau of the Census electronic computers.

Estimating methods.—Each statistic produced by the survey—for example, the number of work-loss days occurring in a specified period—is the result of two stages of ratio estimation. In the first of these, the factor is the ratio of the 1950 decennial population count to the 1950 estimated population in the U.S. National Health Survey's first-stage sample of PSU's. These factors are applied for some 50 color-residence classes.

Later, ratios of sample-produced estimates of the population to official Bureau of the Census figures for current population in about 60 age-sex-color classes are computed, and serve as second-stage factors for ratio estimating.

The effect of the ratio estimating process is to make the sample more closely representative of the population by age, sex, color, and residence, thus reducing sampling variance.

As noted, each week's sample represents the population living during that week and characteristics of the population. Consolidation of samples over a time period, say a calendar quarter, produces estimates of average characteristics of the U.S. population for that calendar quarter.

For prevalence statistics, such as the number of persons with a specific chronic condition, figures are first calculated for each calendar quarter by averaging estimates for all weeks of interviewing in that quarter. Prevalence data for a year are then obtained by averaging the four quarterly figures.

For statistics measuring the number of occurrences during a specified time period, such as the number of bed-disability days, a similar computational procedure is used, but the statistics have a different interpretation. For these items, the questionnaire asks for the respondent's experience over the 2-calendar weeks prior to the week of interview. In such instances the estimated quarterly total for the statistic is simply 6.5 times the average 2-week estimate produced by the 13 successive samples taken during the period. The annual total is the sum of the four quarters. Thus, the experience of persons interviewed during a year—experience which actually occurred for each person in a 2-calendar-week interval prior to week of interview—is treated as though it measured the total of such experience during the year. Such interpretation leads to no significant bias.

General Qualifications

Nonresponse.—Data were adjusted for nonresponse by a procedure which imputes to persons in a household which was not interviewed the characteristics of persons in households in the same segment which were interviewed. The total noninterview rate was 5 percent; 1 percent was refusal, and the remainder was primarily due to the failure to find any eligible household respondent after repeated trials.

The interview process.—The statistics presented in this report are based on replies secured in interviews of persons in the sampled households. Each person 17 years of age and over, available at the time of interview, was interviewed individually. Proxy respondents within the household were employed for children and for adults not available at the time of the interview, provided the respondent was closely related to the person about whom information was being obtained.

There are limitations to the accuracy of diagnostic and other information collected in household interviews. For diagnostic information, the household respondent can, at best, pass on to the interviewer only the information the physician has given to the family. For conditions not medically attended, diagnostic information is often no more than a description of symptoms. However, other facts, such as the number of disability days caused by the condition, can be obtained more accurately from household members than from any other source since only the persons concerned are in a position to report this information.

Rounding of numbers.—The original tabulations on which the data in this report are based show all estimates to the nearest whole unit. All consolidations were made from the original tabulations using the estimates to the nearest unit. In the final published tables the figures are rounded to the nearest thousand, although these are not necessarily accurate to that detail. Derived statistics such as rates and percent distributions are computed after the estimates on which they are based have been rounded to the nearest thousand.

Population figures.—Some of the published tables include population figures for specified categories. Except for certain over-all totals by age and sex, which are adjusted to independent estimates, these figures are based on the sample of households in the U. S. National Health Survey. They are given primarily to provide denominators for rate computation, and for this purpose are more appropriate for use with the accompanying measures of health characteristics than other population data that may be available. In some instances they will permit users to recombine published data into classes more suitable to their specific needs. With the exception of the over-all totals by age and sex, mentioned above, the population figures differ from corresponding figures

(which are derived from different sources) published in reports of the Bureau of the Census. For population data for general use, see the official estimates presented in Bureau of the Census reports in the P-20, P-25, and P-60 series.

Reliability of Estimates

Since the estimates are based on a sample, they will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and interviewing personnel and procedures. As in any survey, the results are also subject to measurement error.

The standard error is primarily a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. As calculated for this report, the standard error also reflects part of the variation which arises in the measurement process. It does not include estimates of any biases which might lie in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error and about 99 out of 100 that it would be less than $2\frac{1}{2}$ times as large.

The relative standard error of an estimate is obtained by dividing the standard error of the estimate by the estimate itself, and is expressed as a percentage of the estimate. Included in this Appendix are charts from which the relative standard errors can be determined for estimates shown in the report. In order to derive relative errors which would be applicable to a wide variety of health statistics and which could be prepared at a moderate cost, a number of approximations were required. As a result, the charts provide an estimate of the approximate relative standard error rather than the precise error for any specific aggregate or percentage.

Three classes of statistics for the health survey are identified for purposes of estimating variances.

Narrow range.—This class consists of (1) statistics which estimate a population attribute, e.g., the number of persons in a particular income group, and (2) statistics for which the measure for a single individual for the period of reference is usually either 0 or 1, on occasion may take on the value 2, and very rarely, 3.

Medium range.—This class consists of other statistics for which the measure for a single individual for the period of reference will rarely lie outside the range 0 to 5.

Wide range.—This class consists of statistics for which the measure for a single individual for the period of reference frequently will range from 0 to a number in excess of 5, e.g., the number of days of work loss experienced during the year.

In addition to classifying variables according to whether they are narrow-, or medium-, or wide-range, statistics in the survey are further defined as:

Type A.—Statistics on prevalence, and incidence data for which the period of reference in the questionnaire is 12 months.

Type B.—Incidence-type statistics for which the period of reference in the questionnaire is 2 weeks.

Type C.—Statistics on data, such as hospitalization, for which the period of reference is 6 months.

Only the charts on sampling error applicable to data contained in this report are presented. Those shown are charts for aggregates and percentages based on 4-calendar quarters of data collection.

General rules for determining relative sampling errors.—The "guide" on page 39, together with the following rules, will enable the reader to determine approximate relative standard errors from the charts for estimates presented in this report.

Rule 1. Estimates of aggregates: Approximate relative standard errors of estimates of aggregates, such as the number of persons with a given characteristic, or the number of disability days are obtained from appropriate curves on pages 40-42. The number of persons in the total U.S. population or in an age-sex class of the total population is adjusted to official Bureau of the Census figures and is not subject to sampling error.

Rule 2. Estimates of percentages in a percent distribution; (Not required for statistics presented in this report.)

Rule 3. Estimates of rates where the numerator is a subclass of the denominator; (Not required for statistics presented in this report.)

Rule 4. Estimates of rates where the numerator is not a subclass of the denominator: This rule applies where a unit of the numerator often occurs more than once for any one unit in the denominator. For example, in computing the number of days of work loss per person per year, several of the days included in the numerator could be assigned to a person (one unit) in the denominator. Approximate relative standard errors for rates of this kind may be computed as follows:

(a) Where the denominator is the total U.S. population, or includes all persons in one or more of the age-sex groups of the total population, the relative error of the rate is equivalent

to the relative error of the numerator which can be obtained directly from the appropriate chart.

- (b) In other cases, obtain the relative standard error of the numerator and of the denominator from the appropri-

ate curve. Square each of these relative errors, add the resulting values, and extract the square root of the sum. This procedure will result in an upper bound, and often will overstate the error.

Guide to Use of Relative Standard Error Charts

The code shown below identifies the appropriate curve to be used in estimating the relative standard error of the statistic described. The four components of each code describe the statistic as follows: (1)

A = aggregate, P = percentage; (2) the number of calendar quarters of data collection; (3) the type of the statistic as described on page 37; and (4) the range of the statistic as described on page 37.

Topic and statistic	Use:

Relative standard errors for aggregates based on four quarters of data collection
for data of all types and ranges

Example of use of chart: An aggregate of 2,000,000 (on scale at bottom of chart) for a Narrow range Type A statistic (code: A4AN) has a relative standard error of 3.6 percent, (read from scale at left side of chart), or a standard error of 72,000 (3.6 percent of 2,000,000). For a Wide range Type B statistic (code: A4BW), an aggregate of 6,000,000 has a relative error of 16.0 percent or a standard error of 960,000 (16 percent of 6,000,000).

Relative standard errors for aggregates based on eight quarters of data collection for type C, Narrow range, and type C Wide range data

Example of use of chart: An aggregate of 1,000,000 (on scale at bottom of chart) for a Narrow range type C statistics (code A8CN) has a relative standard error of 5.6 percent, read from scale at left side of chart, or a standard error of 56,000 (5.6 percent of 1,000,000).

Relative standard errors for aggregates based on eight quarters of data collection
for data of all types and ranges

Example of use of chart: An aggregate of 5,000,000 (on scale at bottom of chart) for a Narrow range type A statistic (code: A8AN) has a relative standard error of 1.9 percent, read from scale at left side of chart, or a standard error of 95,000 (1.9 percent of 5,000,000). For a Wide range type B statistic (code: A8BW), an aggregate of 10,000,000 has a relative error of 9.3 percent or a standard error of 930,000 (9.3 percent of 10,000,000).

APPENDIX II

DEFINITIONS OF CERTAIN TERMS USED IN THIS REPORT

Demographic and Economic Terms

Age.—The age recorded for each person is his age at last birthday. Age is recorded in single years and combined into groups suitable for the purpose of the table.

Income of family or of unrelated individuals.—Each member of a family is classified according to the total income of the family of which he is a member. Within the household all persons related to each other by blood, marriage, or adoption constitute a family. Unrelated individuals are classified according to their own income.

The income recorded is the total of all income received by members of the family (or by an unrelated individual) in the 12-month period ending with the week of interview. Income from all sources is included, e.g., wages, salaries, rents from property, pensions, help from relatives, and so forth.

Currently employed persons.—Currently employed persons are all persons 17 years of age or over who reported that at any time during the 2-week period covered by the interview they either worked at, or had a job or business. Current employment includes paid work as an employee of someone else, self-employment in business, farming, or professional practice, and unpaid work in a family business or farm. Persons who were temporarily absent from their job or business because of a temporary illness, vacation, strike, or bad weather are considered as currently employed if they expected to work as soon as the particular event causing their absence no longer existed.

Free-lance workers are also considered as currently employed if (1) they had some formal arrangements for being called to work, such as having made arrangements with a union hiring hall to be called for work when it became available, or (2) they were repeatedly called upon to work by a particular employer or group of employers, e.g., a woman who did babysitting for a number of different families.

Persons excluded from the currently employed population are (1) persons receiving revenue from an enterprise in whose operation they did not participate, (2) persons doing housework or charity work for which they received no pay, and (3) seasonal workers during the unemployment season.

Terms Relating to Disability

Disability.—Disability is a general term used to describe any temporary or long-term reduction of a person's activity as a result of an acute or chronic condition.

Disability day.—The following terms are used to describe the disability resulting from illness or injury: days of restricted activity, days of bed disability, hospital days, and days lost from work or school. All hospital days are, by definition, days of bed disability; all days of bed disability are, by definition, days of restricted activity. The converse form of these statements is, of course, not true. Days lost from work and days lost from school are special terms which apply to the currently employed and the school-age populations only, but these, too, are days of restricted activity. Hence, "restricted activity" is the most inclusive term used to describe the disability reported in the interview. Certain of the terms used in connection with disability measures are defined more explicitly below.

Restricted-activity day.—A day of restricted activity is one on which a person substantially reduces the amount of activity normal for that day because of a specific illness or injury. The type of reduction varies with the age and occupation of the individual as well as with the day of the week or season of the year. Restricted activity covers the range from substantial reduction to complete inactivity for the entire day.

Bed-disability day.—A day of bed disability is one on which a person stays in bed for all or most of the day because of a specific illness or injury. All or most of the day is defined as more than half the daylight hours. All hospital days for inpatients are considered to be days of bed disability even if the patient was not actually in bed at the hospital.

Work-loss day.—A day is counted as lost from work if the person would have been going to work at a job or business that day but instead lost the entire work day because of an illness or an injury. If the person's regular work day is less than a whole day and the entire work day was lost, it would be counted as a whole work day lost. Work-loss days are determined only for currently employed persons 17 years of age and over.

School-loss day.—A day is counted as lost from school if the child would have been going to school that

day but instead lost the entire school day because of an illness or an injury. If the child's regular school day lasts only a part of a day and that part was lost from school, this would count as a whole day lost. School-loss days are determined only for children 6-16 years of age.

Person-days of restricted activity, bed disability, etc.—Person-days of restricted activity, bed disability, and so forth are days of the various forms of disability experienced by any one person. The sum of days for all persons in a group represents an unduplicated count of all days of disability for the group.

Terms Relating to Hospitalization

Hospital discharge.—A hospital discharge is the completion of any continuous period of stay of one or more nights in a hospital, as an inpatient, except the period of stay of a well, newborn infant. A hospital discharge is recorded whenever a present member of the household is reported to have been discharged from a hospital in the 12-month period prior to the interview week. (For this report estimates were based on discharges which occurred during the 6-month period prior to the interview. See Appendix I.)

Hospital.—For this survey a hospital is defined as any institution meeting one of the following criteria: (1) named in the listing of hospitals in the 1957-1959 Guide Issues of Hospitals, the Journal of the American Hospital Association; (2) named in the listing of hospitals in the 1957-1960 Directories of the American Osteopathic Hospital Association; or (3) named in the annual inventory of hospitals and related facilities submitted by the States to the Division of Hospital and Medical Facilities of the U.S. Public Health Service in conjunction with the Hill-Burton program.

Short-stay hospital.—A short-stay hospital is one for which the type of service is: general; maternity; eye, ear, nose, and throat; children's; osteopathic hospital; or hospital department of institution.

Hospital day.—A hospital day is a day in which a person is confined to a hospital. The day is counted as a hospital day only if the patient stays overnight. Thus, a patient who enters the hospital on Monday afternoon and leaves Wednesday noon is considered to have had two hospital days.

Estimates of the total number of hospital days are derived by summing the days for all hospital discharges. (See definition of "Hospital discharge.")

Length of hospital stay.—The length of hospital stay is the duration in days, exclusive of the day of discharge, of a hospital discharge. (See definition of "Hospital discharge.")

Average length of hospital stay.—The average length of hospital stay per discharged patient is computed by dividing the total number of hospital days for a specified group by the total number of discharges for the same group.

Hospital bill.—A hospital bill is defined as the bill submitted by the hospital to the patient for the care and services received during the period of hospitalization. Bills submitted to the patient by doctors, surgeons, anesthetists, or other individuals for services rendered during the period of hospitalization are not considered as part of the hospital bill.

The hospital bill will normally include the cost of the room, meals, regular nursing service, laboratory tests, X-rays, medicines, injections, use of the operating room, and other services that may be provided for the patient. When the charges for special nurses, anesthetists, ambulance service, etc., are included by the hospital on the bill submitted to the patient, these are also considered as part of the hospital bill for purposes of the Survey.

Hospital insurance.—Hospital insurance is any insurance plan designed to pay all or part of the hospital bill (see definition of "Hospital bill") of the insured individual. The insurance can be either a group or an individual policy with the premiums paid by the individual, his employer, a third party such as a union, fraternal organization or family member, or a combination of these. Benefits received under the plan can be in the form of payment to the individual or to the hospital. However, the plan must be a formal one with defined membership and benefits rather than an informal one. For example, an employer simply paying the hospital bill for an employee would not constitute a health insurance plan. "Workmen's compensation," or employee's liability insurance, designed to pay all or part of the hospital bill of the employee, is considered as hospital insurance. The important ingredient in this definition is that the person receiving the benefit has been specifically named either as an individual or, part of a specified group.

The insurance does not have to cover costs of hospitalization for all diseases and injuries, as long as it covers the particular condition for which the person was hospitalized.

The use of funds from other kinds of insurance benefits to pay hospital bills, such as Social Security benefits or disability insurance would not be counted as hospital insurance. Free hospital care is not considered hospital insurance. Examples of free care are public assistance or public welfare care, veteran's care given free of charge, care given to dependents of military personnel (Medicare Plan), care given children under the Crippled Children's program, and care of patients admitted free for research purposes. Also excluded as hospital insurance in this study is liability insurance that pays for hospital care, if it is carried by someone other than the person hospitalized, his family, his employer, or his union or fraternal organization. For example, a person hospitalized from an automobile accident in which the person other than the one hospitalized carried liability insurance that paid for the hospital care for the person injured.

Terms Relating to Persons Injured

Injury condition.—An injury condition, or simply an injury, is a condition of the type that is classified to the nature of injury code numbers (N800-N999) in the International Classification of Diseases. In addition to fractures, lacerations, contusions, burns, and so forth, which are commonly thought of as injuries, this group of codes include: effects of exposure, such as sunburn; adverse reactions to immunizations and other medical procedures, and poisonings. Unless otherwise specified, the term injury is used to cover all of these.

Since a person may sustain more than one injury in a single accident, e.g., a broken leg and laceration of the scalp, the number of injury conditions may exceed the number of persons injured.

Statistics of acute injury conditions include only those injuries which involved at least one full day of restricted activity or medical attendance.

Medically attended injury.—An injury for which a physician was consulted is called a medically attended injury. Consulting a physician includes consultation in person or by telephone for treatment or advice. Advice from the physician transmitted to the patient through the nurse is counted as medical consultation as well as visits to physicians in clinics or hospitals. If at one visit the physician is consulted about more than one injury for each of several patients, each injury is counted as medically attended.

A parent consulting a physician about a child's injury is counted as medical consultation about that injury even if the child was not seen by the physician at that time.

For the purpose of this definition "physician" includes doctors of medicine and osteopathic physicians. The term "doctor" is used in the interview, rather than "physician," because of the need to keep to popular usage. However, the concept toward which all instructions are directed is that which is described here.

An injury is counted as medically attended if a physician was consulted about it at its onset or at any time thereafter. However, the first medical attention for an injury that was experienced during the 2-week period prior to the household interview may not occur until after the date of the interview. Such cases are necessarily treated as though there has been no medical attention.

Person injured.—A person injured is one who has sustained one or more injuries in an accident or in some type of nonaccidental violence (see definition of "Injury condition" above). Each time a person is involved in an accident or in nonaccidental violence causing injury that results in at least one full day of restricted activity or medical attention, he is included in the statistics as a separate "person injured," hence, one person may be included more than once.

The number of persons injured is not equivalent to the number of "accidents" for several reasons: (1)

the term "accident" as commonly used may not involve injury at all; (2) more than one injured person may be involved in a single accident so that the number of accidents resulting in injury would be less than the number of persons injured in accidents; and (3) the term "accident" ordinarily implies an accidental origin, whereas "persons injured" as used in the National Health Survey includes persons whose injury resulted from certain nonaccidental violence.

The number of persons injured in a specified time interval is always equal to or less than the incidence of injury conditions, since one person may incur more than one injury in a single accident.

Terms Relating to Class of Accident

Class of accident.—Injuries, injured persons, and resulting days of disability may be grouped according to class of accident. This is a broad classification of the types of events which resulted in persons being injured. Most of these events are accidents in the usual sense of the word, but some are other kinds of mishap, such as overexposure to the sun or adverse reactions to medical procedures, and others are nonaccidental violence, such as attempted suicide. The classes of accidents are: (1) motor vehicle accidents, (2) accidents occurring while at work, (3) home accidents, and (4) other accidents. These categories are not mutually exclusive. For example, a person may be injured in a motor vehicle accident which occurred while the person was at work. In this report, the accident class "motor vehicle" includes "home-motor vehicle" and "while at work-motor vehicle"; the accident class "while at work" includes "home-while at work"; therefore the class "home accidents" excludes combinations with "while at work" and "motor vehicle."

Motor vehicle accident.—The class of accident is "motor vehicle" if a motor vehicle was involved in any way. Thus, it is not restricted to moving motor vehicles or to persons riding in motor vehicles. A motor vehicle is any mechanically or electrically powered device, not operated on rails, upon which or by which any person or property may be transported or drawn upon a land highway. Any object, such as a trailer, coaster, sled, or wagon, being towed by a motor vehicle is considered a part of the motor vehicle. Devices used solely for moving persons or materials within the confines of a building and its premises are not counted as motor vehicles.

Accident while at work.—The class of accident is "while at work" if the injured person was 17 years of age or over and was at work at a job or a business at the time the accident happened.

Home accident.—The class of accident is "home" if the injury occurred either inside the house or outside the house. "Outside the house" refers to the yard, buildings, and sidewalks on the property. "Home" includes not only the person's own home but also any other home in which he might have been when he was injured.

Other.—The class of accident is "other" if the occurrence of injury cannot be classified in one or more of the first three class-of-accident categories. This category therefore includes persons injured in public places (e.g., tripping and falling in a store or on a public sidewalk), and also nonaccidental injuries such as homicidal and suicidal attempts. The survey

does not cover the military population, but current disability of various types resulting from prior injury occurring while the person was in the Armed Forces is covered and is included in this class. The class also includes mishaps for which the class of accident could not be ascertained.

APPENDIX III

QUESTIONNAIRE

The items below show the exact content and wording of the basic questionnaire used in the nationwide household survey of the U. S. National Health Survey. The actual questionnaire is designed for a household as a unit and includes additional spaces for reports on more than one person, condition, accident or hospitalization. Such repetitive spaces are omitted in this illustration.

CONFIDENTIAL - The National Health Survey is authorized by Public Law 652 of the 84th Congress (70 Stat 49; 42 U.S.C. 305). All information which would permit identification of the individual will be held strictly confidential, will be used only by persons engaged in and for the purposes of the survey, and will not be disclosed or released to others for any other purposes (22 FR 1687).

FORM NHS-3 (6-19-55)		U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS ACTING AS COLLECTING AGENCY FOR THE U.S. PUBLIC HEALTH SERVICE				1. Questionnaire of Questionnaires	
2. (a) Address or description of location		3. Ident. Code	4. Sub-sample weight	5. Sample Number	6. PSU Number	7. Segment No.	8. Serial No.
(b) Mailing address if not shown in (a)		9. Is this house on a farm or ranch? <input type="checkbox"/> Yes <input type="checkbox"/> No					
(c) Type of living quarters <input type="checkbox"/> Dwelling unit <input type="checkbox"/> Other	(d) Name of Special Dwelling Place	Code		10. What is the telephone number here? <input type="checkbox"/> No phone		11. In case I've overlooked anything, what is the best time to call?	
12. Are there any other living quarters, occupied or vacant, in this building (apartment)? <input type="checkbox"/> Yes <input type="checkbox"/> No		INSTRUCTIONS					
13. Does anyone else living in this building use YOUR ENTRANCE to get to his living quarters? <input type="checkbox"/> Yes <input type="checkbox"/> No		If "Yes" to questions 12, 13 or 14 apply definition of a dwelling unit to determine whether one or more additional questionnaires should be filled and whether the listing is to be corrected.					
14. Is there any other building on this property for people to live in - either occupied or vacant? <input type="checkbox"/> Yes <input type="checkbox"/> No		15. RECORD OF CALLS AT HOUSEHOLDS					
Item		1		2		3	
Entire household		Date		Date		Date	
Callbacks for individual respondents		Date		Date		Date	
Cat. No.		Time		Time		Time	
16. REASON FOR NON-INTERVIEW							
TYPE		A		B		C	
Reason:		<input type="checkbox"/> Refusal <input type="checkbox"/> No one at home - repeated calls <input type="checkbox"/> Temporarily absent <input type="checkbox"/> Other (Specify)		<input type="checkbox"/> Vacant - non-seasonal <input type="checkbox"/> Vacant - seasonal <input type="checkbox"/> Usual residence elsewhere <input type="checkbox"/> Armed Forces <input type="checkbox"/> Other (Specify)		<input type="checkbox"/> Demolished <input type="checkbox"/> In sample by mistake <input type="checkbox"/> Eliminated in sub-sample <input type="checkbox"/> Other (Specify)	
						Interview not obtained for: Code, because:	
Comments on non-interview							
17. Signature of interviewer						18. Code	
Special instructions or notes							

1. (a) What is the name of the head of this household? (Enter name in first column)		Last name (1)	
(b) What are the names of all other persons who live here? (List all persons who usually live here, and all persons staying here who have no usual place of residence elsewhere. List these persons in the prescribed order.)		First name and initial	
(c) Do any (other) lodgers or roomers live here? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) →			
(d) Is there anyone else who lives in a home who is now away on business? On a visit? Temporarily in a hospital? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) →			
(e) Is there anyone else staying here now? <input type="checkbox"/> No <input type="checkbox"/> Yes (List) →			
(f) Do any of the people in this household have a home elsewhere? <input type="checkbox"/> No (leave on questionnaire) <input type="checkbox"/> Yes (if not a household member, delete)			
2. How was you related to the head of the household? (Enter relationship to head, for example: head, wife, daughter, grandson, mother-in-law, partner, lodger, lodger's wife, etc.)		Relationship Head	
3. How old were you on your last birthday?		Age <input type="checkbox"/> Under 1 year	
4. Race (Check one box for each person)		<input type="checkbox"/> White <input type="checkbox"/> Negro <input type="checkbox"/> Other	
5. Sex (Check one box for each person)		<input type="checkbox"/> Male <input type="checkbox"/> Female	
6. Are you now married, widowed, divorced, separated or never married? (Check one box for each person)		<input type="checkbox"/> Under 17 years <input type="checkbox"/> Married <input type="checkbox"/> Divorced <input type="checkbox"/> Widowed <input type="checkbox"/> Separated <input type="checkbox"/> Never married	
7. What is the highest grade you completed in school? (Circle highest grade completed or check "None")		Elem: 1 2 3 4 5 6 7 8 High: 1 2 3 4 College: 1 2 3 4 5+ <input type="checkbox"/> None	
8. (a) Did you ever serve in the Armed Forces of the United States? If "Yes," ask: (b) Are you now in the Armed Forces, not counting the reserves? (If "Yes," delete this person from questionnaire) →		<input type="checkbox"/> Fem. or und. 17 yrs. <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Yes <input type="checkbox"/> No	
(c) Was any of your service during a war or was it peace-time only? If "War," ask: (d) During which war did you serve? If "Peace-time" only, ask: (e) Was any of your service between June 27, 1950 and January 31, 1957?		<input type="checkbox"/> War <input type="checkbox"/> Peace-time only <input type="checkbox"/> WW I <input type="checkbox"/> Korean <input type="checkbox"/> Other <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Yes <input type="checkbox"/> No	
9. (a) What were you doing most of the past 12 months... (For males): working, or doing something else? (For females): working, keeping house, or doing something else? If "Something else" checked, and person is 45 years old or over, ask: (b) Are you retired?		<input type="checkbox"/> Under 17 years <input type="checkbox"/> Working <input type="checkbox"/> Keeping house <input type="checkbox"/> Something else <input type="checkbox"/> Yes <input type="checkbox"/> No	
10. (a) Were you working last week or the week before? If any entry in q. 9 (a) besides "Working," ask: (b) Did you work at a job or business at any time last week or the week before? If "No" in q. 10 (a) or 10 (b), ask: (c) Even though you did not work last week or the week before, do you have a job or business?		<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Yes <input type="checkbox"/> No	

NOTE: Beginning with question 11 you are to interview for himself or herself, each adult person who is at home.

11. Were you sick at any time LAST WEEK OR THE WEEK BEFORE? (that is, the 2-week period which ended last Sunday)? (a) What was the matter? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
12. Last week or the week before did you take any medicine or treatment for any condition (besides... which you told me about)? (a) For what condition? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
13. Last week or the week before did you have any accidents or injuries? (a) What were they? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
14. Did you ever have on (any other) accident or injury that was still bothering you last week or the week before? (a) How did it bother you? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
15. AT THE PRESENT TIME do you have any ailments or conditions that have lasted for a long time? (If "No") Even though they don't bother you all the time? (a) What are they? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/> No
16. Has anyone in the family - you, your-, etc. - had any of these conditions DURING THE PAST 12 MONTHS? (Read Card A, condition by condition; record any conditions mentioned in the column for the person)	<input type="checkbox"/> Yes <input type="checkbox"/> No
17. Does anyone in the family have any of these conditions? (Read Card B, condition by condition; record any conditions mentioned in the column for the person)	<input type="checkbox"/> Yes <input type="checkbox"/> No
R Show in each person's column who responded for questions 11-17. If person responded for self, show whether entirely or partly.	<input type="checkbox"/> Responded for self-entirely <input type="checkbox"/> Responded for self-partly Col. No. _____ was respondent

Table I - ILLNESSES, IMPAIRMENTS AND INJURIES

Line number	Col. No. of Person	Did you EVER or any time talk to a doctor about ...?	What did the doctor say it was? ... did he give it a medical name? For an injury occurring during a past 2 weeks, ask: What part of the body was hurt? What kind of injury was it? Anything else? (Also, fill Table A) (Record present effects of earlier injuries in Table I and the accident in Table A) (If doctor not talked to record respondent's description)	What was the cause of ...? (This column to be asked if entry in Col. (d-1) is an Impairment or a Symptom If entry in Col. (d-1) is from q. 14 or q. 17 (If "Cause" is an injury, also fill Table A)	If eye trouble of any kind and 6 years old or over, ask: Can you see well enough to read ordinary newspaper print with glasses?	What kind of ... trouble is it? Ask only for: Any entry in Col. (d-1) or (d-2) that includes the word: "Trouble" "Condition" "Disease" and, also for any entry of: "Allergy" "Anemia" "Arthritis" "Asthma" "Hemiplegia" (any mention of "right" or "left") "Stroke" (or "eye", "gum", "tooth") "Tumor" (or "eye", "gum", "tooth")	What part of the body is affected? Ask only for: Impairments Injuries Abscesses, boils Infections, inflammation, sores, ulcers Aches, pains, soreness, weakness Bleeding or blood clots Cancer, tumor cysts or growths Neuralgia or neuritis Head - (Skull, scalp or face) Spine - (Upper, middle or lower) Arm - (Shoulder, upper, elbow, lower, wrist hand) Leg - (Hip, upper, knee, lower, ankle, foot toe)	LAST WEEK OR THE WEEK BEFORE did ... cause you to cut down on your usual activities for days as much as on Sunday?	How many days, including the day?	How many of these days were you in bed all or most of the day?	If 6-16 years old ask: How many days did ... keep you from school last week or the week before?
								Check one No Yes (Go to Col. (h))	(a)	(b)	(c)
1		<input type="checkbox"/> Yes <input type="checkbox"/> No	(d-1)	(d-2)	<input type="checkbox"/> Yes <input type="checkbox"/> No	(d-4)	(e)	(f)	(g)	(h)	

Table II - HOSPITALIZATION DURING PAST 12 MONTHS

Line number	Col. No. of person	Question No.	When did you enter the hospital? (Month, year)	To Interviewer				What did they say at the hospital the condition was - did they give it a medical name? (If "day" didn't say, ask: What did the last doctor you talked to say it was? (Show same detail as in col. (d-1)-(d-5) of T.I) (If condition from accident or injury, also fill Table A)	Were any operations performed on you during this stay at the hospital? (a) What was the name of the operation? (b) Any other operations?
				How many days were you in the hospital, not counting the day you left?	How many days were you in the past 12 months?	Will you need to ask to see (f) and (g)?	How many days were in the hospital on last Sunday night?		
1			Mo: _____ Ye: _____	<input type="checkbox"/> All or Days	<input type="checkbox"/> Yes <input type="checkbox"/> No	Days	<input type="checkbox"/> Yes <input type="checkbox"/> No	(c)	<input type="checkbox"/> Yes <input type="checkbox"/> No

Table A - (Accidents and Injuries)

1. When did it happen? Year _____ (If the year is 1959 or 1960, also enter the month) _____
Month _____ Accident happened last week or the week before

2. At the time of the accident, what part of the body was hurt? What kind of injury was it? Anything else? Accident happened last week or the week before

3. (a) Was a car, truck, bus or other motor vehicle involved in any way? Yes No (Go to q. 7)
(b) Was more than one motor vehicle involved? Yes (more than one) No
(c) Was it (either one) moving at the time? Yes No (Go to q. 7)

4. Were you outside the vehicle, getting in or out of it, a passenger or were you the driver?
1. Outside 2. Getting in or out 3. Passenger 4. Driver

If "Outside"

5. (a) How did the accident happen?
1. Collision between motor vehicle and person riding on bicycle, in wheelchair, on railroad train, or horse-drawn vehicle
2. Collision between motor vehicle and person who was walking, running, or standing
3. Other (Specify) _____
(b) What kind of motor vehicle was involved?
1. Car 2. Taxi 3. Bus 4. Truck 5. Motorcycle (Go to question 8) 6. Other (Specify) _____
If "Getting in or out," "Passenger" or "Driver"

6. (a) How did the accident happen?
1. Collision with another motor vehicle on roadway
2. Collision with some other object on roadway (Specify object) _____
3. Came to sudden stop on roadway
4. Ran off roadway
5. Other (Specify) _____
(b) What kind of motor vehicle were you in (getting in) (getting out of) when the accident happened?
1. Car 2. Taxi 3. Bus 4. Truck 5. Motorcycle (Go to question 8) 6. Other (Specify) _____

<p>18. (a) I have some questions about health insurance. We don't want to include insurance that pays ONLY for accidents, but we are interested in all other kinds... Do you, your..., have insurance that pays all or part of the bills when you go to the hospital?</p> <p>If "Yes,"</p> <p>(b) What is the name of the plan (or plans)? Any other plans?</p> <p>(c) Who is covered by this plan (each plan)? (Check "Yes," in 18(a) for each person covered)</p> <p>(d) Does the plan (either plan) pay any part of the surgeon's bill for an operation?</p>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> DK Name(s) <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> DK
<p>19. (a) Again, excluding insurance that pays ONLY for accidents, do you, your... have insurance that pays all or part of the bill for doctors' visits at home or at his office? If "Yes,"</p> <p>(b) What is the name of the plan (or plans)? Any other plans?</p> <p>(c) Who is covered by this plan (each plan)? (Check "Yes," in 19(a) for each person covered)</p>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> DK Name(s) <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> DK
<p>20. (a) DURING THE PAST 12 MONTHS has anyone in the family been a patient in a hospital overnight or longer?</p> <p>If "Yes,"</p> <p>(b) How many times were you in the hospital?</p>	<input type="checkbox"/> Responded for self <input type="checkbox"/> Col. No. _____ was respondent <input type="checkbox"/> Form NHS-3 (a) left <input type="checkbox"/> Yes (Table II) <input type="checkbox"/> No _____ No. of times
<p>21. (a) During the past 12 months has anyone in the family been a patient in a nursing home or sanitarium?</p> <p>If "Yes,"</p> <p>(b) How many times were you in a nursing home or sanitarium?</p>	<input type="checkbox"/> Yes (Table II) <input type="checkbox"/> No _____ No. of times
<p>22. During the past 12 months in which group did the total income of your family fall, that is, your's, your's..., etc.? (Show Card H) Include income from all sources, such as wages, salaries, rents from property, pensions, help from relatives, etc.</p>	Group No. _____

Table I - ILLNESSES, IMPAIRMENTS AND INJURIES

If "Yes," in q. 10(a), 10(b), or 10(c), ask	Did you first notice... (did it happen) DURING THE PAST 3 MONTHS or before that time?	To Interview: (k) Is checked, or the condition is on either one of Cards A or B, continue; otherwise STOP	Did you first notice... (did it happen) DURING THE PAST 12 MONTHS or before that time? (If during past 12 months, ask: Which month?)	How long since you last talked to a doctor about...? (If less than one month, enter "1" for "No.")	Do you still take any medicine or treatment that the doctor prescribed for...? Or, follow any advice he gave?	About how many days during the past 12 months has... ask: How many of these days were during last week or the week before?	If 1 or more in Col. (q-1) and "No" in Col. (e), has... ask: How many of these days were during last week or the week before?	Ask after completing last condition for each person:				If "1" or "2" or "3" in col. (f) ask: (e) ask:
								Please look at this card and read each statement. Then tell me which one you have told me about? (Show Cards C-F, as appropriate)	If "1" or "2" in col. (f) ask: (a) Which? (b) How long have you been...? (c) (Insert the words of the statement selected)	If "1" or "2" in col. (f) ask: (d) How long have you been...? (e) Were you working at a job or business up to that time?	If "1" or "2" or "3" in col. (f) ask: (f) Please look at this card and read each statement. Then tell me which one you have told me about? (Show Card G)	
Days <input type="checkbox"/> None	Check one Before 3 mos. (Go to card (e)) During 3 mos. (f)	Did... start during the past 2 weeks or before that time? (If during past 2 weeks, ask: Which week, last week or the week before?)	Mo. _____ Yr. _____ <input type="checkbox"/> Before 12 months	Mo. _____ Yr. _____ <input type="checkbox"/> No Dr.	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> No Dr.	Days <input type="checkbox"/> None	Days <input type="checkbox"/> None	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	Mo. _____ Yr. _____ <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	1

Table II - HOSPITALIZATION DURING PAST 12 MONTHS

<p>What is the name and address of the hospital you were in? (Enter name, city and State; if city not known, enter County)</p>	<p>For completed hospitalizations only ("No" in Col. (g)):</p> <p>Was any of the hospital bill paid for by any kind of insurance? Or, by any kind of plan that pays for hospital costs?</p> <p>If "No" to col. (k), ask: Do you expect any of the hospital bill to be paid for by insurance or any plan of this kind?</p> <p>If "No" to both cols. (k) and (l), ask: What part of the hospital bill was (will be) taken care of by insurance?</p> <p>Who carries the cost of this insurance--that is, who pays the premium?</p>				
(i)	(k)	(l)	(m)	(n)	(o)
<input type="checkbox"/> Yes (Skip to col. n) <input type="checkbox"/> No	<input type="checkbox"/> Yes (Skip to col. n) <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No (Stop)	<input type="checkbox"/> Under 1/2 <input type="checkbox"/> 1/2 up to 3/4 <input type="checkbox"/> 3/4 or more	<input type="checkbox"/> Family member(s) <input type="checkbox"/> Employer <input type="checkbox"/> Union, clubs, etc.	<input type="checkbox"/> Other (Specify) _____

7. How did the accident happen?

<p>A. <input type="checkbox"/> Any injury involving a uncontrolled fire or explosion</p> <p>2. <input type="checkbox"/> Any injury involving the discharge of a firearm</p> <p>3. <input type="checkbox"/> Any injury from an accident involving a non-motor vehicle in motion (streetcar, railroad train, airplane, boat, bicycle, horse-drawn vehicle)</p> <p>B. <input type="checkbox"/> Any injury inflicted by machinery (belt or motor driven) while in operation (Specify type) _____</p> <p>5. <input type="checkbox"/> Any injury inflicted by edge or point of knife, scissors, nail or other cutting or piercing implement</p> <p>6. <input type="checkbox"/> Any injury inflicted by foreign body in eye, windpipe, or other orifice</p> <p>7. <input type="checkbox"/> Any injury inflicted by animal or insect</p> <p>8. <input type="checkbox"/> Any injury inflicted by poisonous substance swallowed (Specify substance) _____</p>	<p>C. <input type="checkbox"/> Fell on stairs or steps or from a height</p> <p>10. <input type="checkbox"/> All other falls</p> <p>11. <input type="checkbox"/> Bumped into object or person (covers all collisions between persons including striking, punching, kicking, etc.)</p> <p>12. <input type="checkbox"/> Struck by moving object (include objects held in own hand or hand of other person, also falling, flying or thrown objects)</p> <p>13. <input type="checkbox"/> Handling or stepping on sharp or rough object (include wounds from splinters, broken glass, etc.)</p> <p>14. <input type="checkbox"/> Caught in, pinched or crushed (i.e., between two moving objects or between a moving and a stationary object)</p> <p>15. <input type="checkbox"/> Came in contact with hot object or substance or open flame</p> <p>16. <input type="checkbox"/> Lifting or other exertion</p> <p>17. <input type="checkbox"/> Tripping, stumbling, etc.</p> <p>D. <input type="checkbox"/> Other (Specify how accident happened) _____</p>
---	--

8. (a) Where did the accident happen--at home or some other place?

1. <input type="checkbox"/> At home (inside house)	2. <input type="checkbox"/> At home (adjacent premises)	<input type="checkbox"/> Some other place
--	---	---

If "Some other place," ask:

(b) What kind of place was it?

3. <input type="checkbox"/> Street and highway	6. <input type="checkbox"/> School, (including school premises)
4. <input type="checkbox"/> Farm	7. <input type="checkbox"/> Place of recreation and sports, except at school
5. <input type="checkbox"/> Industrial place and premises	8. <input type="checkbox"/> Other (Specify) _____

9. Were you at work at your job or business when the accident happened?

1. <input type="checkbox"/> Yes	2. <input type="checkbox"/> No	3. <input type="checkbox"/> While in Armed Services	4. <input type="checkbox"/> Under 17 at time of accident

OUTLINE OF REPORT SERIES FOR VITAL AND HEALTH STATISTICS

Public Health Service Publication No. 1000

SERIES 1-4. GENERAL SERIES. Program descriptions, methodological research, and analytical studies of vital and health statistics.

Earlier reports of this kind have appeared in "Vital Statistics--Special Reports" and in "Health Statistics from the National Health Survey," Series A and D, PHS Publication No. 584.

Series 1: Programs and collection procedures.-- Reports which describe the general programs of the National Center for Health Statistics and its offices and divisions, data collection methods used, definitions, and other material necessary for understanding of the technical characteristics of published data.

Series 2: Data evaluation and methods research.-- Studies of new statistical methodology including: experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, contributions to statistical theory.

Series 3: Analytical Studies.-- This series comprises reports presenting analytical or interpretive studies based on vital and health statistics.

Series 4: Documents and committee reports.-- Final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.

SERIES 10-12. DATA FROM THE NATIONAL HEALTH SURVEY

Earlier reports of the kind appearing in Series 10 have been issued as "Health Statistics from the National Health Survey," Series B and C, PHS Publication No. 584.

Series 10: Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, based on data collected in the continuing National Health Interview Survey.

Series 11: Data from the Health Examination Survey based on the direct examination, testing, and measurement of national samples of the population of the United States, including the medically defined prevalence of specific diseases, and distributions of the population with respect to various physical and physiological measurements.

Series 12: Data from the Health Records Survey relating to the health characteristics of persons in institutions, and on hospital, medical nursing, and personal care received, based on national samples of establishments providing these services and samples of the residents of patients, or of records of the establishments.

SERIES 20-23. DATA FROM THE NATIONAL VITAL STATISTICS SYSTEM

Earlier reports of this kind have been issued in "Vital Statistics--Special Reports."

Series 20: Various reports on mortality, tabulations by cause of death, age, etc., time series of rates, data for geographic areas, States, cities, etc.--other than as included in annual or monthly reports.

Series 21: Data on natality such as birth by age of mother, birth order, geographic areas, States, cities, time series of rates, etc.--compilations of data not included in the regular annual volumes or monthly reports.

Series 22: Data on marriage and divorce by various demographic factors, geographic areas, etc.--other than that included in annual or monthly reports.

Series 23: Data from the program of sample surveys related to vital records. The subjects being covered in these surveys are varied including topics such as mortality by socioeconomic classes, hospitalization in the last year of life, X-ray exposure during pregnancy, etc.
