Basic Data on Women Who Use Family Planning Clinics: United States, 1980

By Barbara Bloom, Division of Health Care Statistics

Introduction

Overview

This report presents basic data on women who used organized family planning clinics in the United States during 1980. The statistics based on data collected from the National Reporting System for Family Planning Services focus on the socioeconomic characteristics, pregnancy history, and contraceptive methods of women patients.

Sources and limitations of the data

The National Reporting System for Family Planning Services is an ongoing survey conducted by the Division of Health Care Statistics of the National Center for Health Statistics in order to collect data on clinic-based visits for medical family planning services in the United States and some of its territories (Guam, Puerto Rico, and the Virgin Islands). The clinics include those operated by public health departments, private organizations (such as affiliates of the Planned Parenthood Federation of America, Inc.), hospitals, and other sites that provide family planning services. Medical family planning visits to private physicians' offices are excluded from the system.

From 1972 through mid-1977, the National Reporting System for Family Planning Services was conducted as a full-count survey, collecting information for every family planning visit at every participating site. Since July 1, 1977, however, the system has been conducted as a sample survey. The sample design for the system was based on a stratified two-stage probability sample. The first stage was the selection of clinics; the second stage was the selection of family planning visits occurring at each sampled clinic. At the time of the sampled visit, a Clinic Visit Record is completed for the family planning patient. Persons seeking *only* pregnancy or venereal disease tests are not counted as family planning patients, nor are persons interested *only* in obtaining contraceptive supplies or counseling.

Although the primary sampling unit in the National Reporting System for Family Planning Services is the family planning visit, an unduplicated count of patients has been obtained by identifying (1) new patients at the time of their initial family planning visit to a family planning service site and (2) continuation and readmission patients at the time of their first visit occurring during the survey year. In this report, continuation and readmission patients are referred to as return patients.

Because the estimates in this report are based on a sampling of family planning clinics rather than on a complete enumeration, they are subject to sampling variability. Appendix I contains a detailed discussion of the reliability of the estimates, survey methodology, and data collection and processing, and appendix II contains the definitions of certain terms used in this report. Appendix III contains a Clinic Visit Record form.

Scope and objectives of this report

The detailed tables in this report present the socioeconomic characteristics and family planning practices of women who used family planning clinics in the United States during 1980. The socioeconomic characteristics are age, race, ethnicity, education, student status (whether currently a student), and welfare status (whether public assistance income is received). The family planning variables shown are contraceptive method prior to this visit, source of prior method, contraceptive method adopted or continued during this visit, medical services provided, number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973.

Data from the territories of Guam, Puerto Rico, and the Virgin Islands are not included in this report. In addition, data on male family planning patients are not included because the number of visits by males to family planning clinics was too small for reliable estimates.

Related publications

Reports based on data collected in the 1978 National Reporting System for Family Planning Services (NRSFPS) that focused on visits to family planning clinics by all women¹ and by teenagers,² as well as a profile of all women patients³ and a profile of teenage women patients⁴ have been published. Reports based on data collected in the 1979 NRSFPS that focused on visits to family planning clinics⁵ and a profile of women patients⁶ also have been published. Reports based on data collected in the 1980 NRSFPS focusing on visits and patients are in preparation.

Other data on the utilization of family planning services are collected by the National Center for Health Statistics. Data on visits to office-based physicians that include a family planning service are collected by means of the National Ambulatory Medical Care

Survey, which is also conducted by the Division of Health Care Statistics.⁷ Statistics on women who made family planning visits either to their own physicians or to organized family planning clinics in the 3 years before the survey are collected by means of the National Survey of Family Growth, which is conducted by the Division of Vital Statistics.⁸ Unlike the other two surveys, the data for the National Survey of Family Growth were collected by means of personal interviews with a national sample of women 15-44 years of age who were ever married or never married with offspring living in the household. Because of differences in the populations sampled, the definitions, and the data collection procedures, estimates on family planning visits from these data systems differ.

List of detailed tables

1. Number of female family planning patients, by patient status and age, and percent distribution by race, ethnicity, education, student status, and public assistance income, according to age: United States, 1980	6	10. Number of female family planning patients by patient status and prior contraceptive method, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to patient status and prior contraceptive method: United States, 1980	21
2. Number of female family planning patients by race and age, and percent distribution by ethnicity, education, student status, and public assistance income, according to race and age: United States, 1980	8	11. Number of female family planning patients by race and prior contraceptive method, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to race and prior contraceptive method: United States, 1980	23
3. Number of female family planning patients, by ethnicity and age, and percent distribution by race, education, student status, and public assistance income, according to ethnicity and age: United States, 1980	9	12. Number of female family planning patients by ethnicity and prior contraceptive method, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to ethnicity and prior contraceptive method: United States, 1980	25
4. Number of female family planning patients, by patient status, age, education, and public assistance income, and percent distribution by prior contraceptive method, source of prior method, contraceptive method adopted, and medical services provided, according to patient status, age, education, and public assistance income: United States, 1980	10	13. Number of female family planning patients by ethnicity and prior contraceptive method, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to ethnicity and prior contraceptive method: United States, 1980	26
5. Number of female family planning patients by race, age, education, and public assistance income, and percent distribution by prior contraceptive method, source of prior method, contraceptive method adopted or continued, and medical services provided, according to race, age, education, and public assistance income: United States, 1980	13	14. Number of female family planning patients by patient status and source of prior method, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to patient status and source of prior method: United States, 1980	27
6. Number of female family planning patients by ethnicity, age, education, and public assistance income, and percent distribution by prior contraceptive method, source of prior contraceptive method, contraceptive method adopted or continued, and medical services provided, according to ethnicity, age, education, and public assistance income: United States, 1980	15	15. Number of female family planning patients by race and source of prior method, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to race and source of prior method: United States, 1980	29
7. Number of female family planning patients by patient status, age, education, and public assistance income, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to patient status, age, education, and public assistance income: United States, 1980	17	16. Number of female family planning patients by ethnicity and source of prior method, and percent distribution by number of pregnancies, number of live births, number of fetal deaths; and number of induced abortions since 1973, according to ethnicity and source of prior method: United States, 1980	30
8. Number of female family planning patients by race, age, education, and public assistance income, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to race, age, education, and public assistance income: United States, 1980	19	17. Number of female family planning patients by patient status and contraceptive method adopted or continued, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to patient status and contraceptive method adopted or continued: United States, 1980	31
9. Number of female family planning patients by ethnicity, age, education, and public assistance income, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to ethnicity, age, education, and public assistance income: United States, 1980		17. Number of female family planning patients by race and contraceptive method adopted or continued, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to race and contraceptive method adopted or continued: United States, 1980	33

18. Number of female family planning patients by ethnicity and contraceptive method adopted or continued, and percent distribution by number of pregnancies, number of live births, number of fetal deaths, and number of induced abortions since 1973, according to ethnicity and contraceptive method adopted or continued: United States, 1980 34
19. Number of female family planning patients by patient status and prior contraceptive method, and percent distribution by contraceptive method adopted or continued, according to patient status and prior contraceptive method: United States, 1980 ... 35

20. Number of female family planning patients by race and prior contraceptive method, and percent distribution by contraceptive method adopted or continued, according to race and prior contraceptive method: United States, 1980 36
21. Number of female family planning patients by ethnicity and prior contraceptive method, and percent distribution by contraceptive method adopted or continued, according to ethnicity and prior contraceptive method: United States, 1980 37

Appendix I. Technical notes

Survey methodology

The National Reporting System for Family Planning Services covers all family planning visits to nonmilitary service sites in the United States, Guam, Puerto Rico, and the Virgin Islands that offer medical family planning services. The survey specifically excludes family planning visits to office-based private physicians' practices; these visits are included in the National Ambulatory Medical Care Survey, which is also conducted by the Division of Health Care Statistics of the National Center for Health Statistics (NCHS). A family planning patient is an individual making one or more family planning visits to a family planning service site.

Sampling design.—The data presented in this report are based on a two-stage stratified sample survey. The first-stage sampling frame was completed during the summer of 1976 and updated for 1980. The frame consisted of a list of family planning service sites enrolled in the full-count survey (the mode in which the survey operated before the adoption of the sampling approach on July 1, 1977), augmented by lists of family planning service sites compiled by the Bureau of Community Health Services of the U.S. Department of Health and Human Services and by the Alan Guttmacher Institute, which, at that time, was the research and development division of the Planned Parenthood Federation of America, Inc. Family planning service sites that were identified on more than one list were deleted from the frame before sample selection.

Before selection of the sample service sites, the sampling frame was arranged into six State groups, which were formed by combining States with similar numbers of family planning service sites. Within each State group, each family planning service site was classified into one of the following three classes according to reported information for the facility's annual number of family planning visits: sites with less than 1,000 visits, sites with 1,000–3,999 visits, and sites with 4,000 visits or more. Within each of the sampling

strata defined by the six State groups and the three visit-size classes, the service sites were ordered by State, type of sponsorship (i.e., public health department, affiliate of the Planned Parenthood Federation of America, Inc., hospital, and other), and county. The sample service sites were systematically selected from these strata after a random start, with the probability of selection ranging from certainty to 1 in 18. The 1980 U.S. sample comprised 1,381 sites, with 81.2 percent of the sites participating in the survey.

In the second stage, family planning visits at each sample site were systematically selected. NCHS assigned each sample site a sampling rate dependent on the site's reported visit volume and the State in which the site was located. Overall, 14 visit sampling rates were used to determine the proportion of each site's family planning visits needed for the survey; the visit sampling rates ranged from certainty to 1 in 30.

Although the survey is based on a sample of family planning visits, estimates for family planning patients can be derived from survey data. Each patient (i.e., an individual making one or more family planning visits) can be uniquely associated with the first visit she made during the calendar year.

The date of the prior family planning visit, if any, for each individual making a sample family planning visit is recorded in item 8 of the Clinic Visit Record (see appendix III). With this information, sample family planning visits that correspond to an individual's first family planning visit during the calendar year can be identified. Of 397,692 sample family planning visits in the United States in 1980, some 220,303 reflect data for the individual's first family planning visit during that year. The patient estimates presented in this report are based on those 220,303 sample family planning visits (or, equivalently, family planning patients in the sample).

Data collection and processing

Visit data were either abstracted from the patient's medical file or obtained by interviewing the patient or

by observation. The primary data collection form is the Clinic Visit Record, which consists of the survey's minimum basic data set (see appendix III).

Each sample service site had the option of collecting data for the survey by participating in a computerized record system, providing NCHS criteria for data collection were met. NCHS required that (1) the record system's data be based on a source document that included the survey minimum basic data set, and (2) the procedures and definitions used to collect such data be consistent with those specified for the survey. About 3 out of 4 sample service sites participating in the 1980 survey collected data by participating in a computerized record system. The remaining sites collected survey data on Clinic Visit Records, which were submitted to NCHS for processing.

The procedure for sampling visits was done in one of two ways. Sample service sites that collected visit data for the survey by participating in a computerized record system usually opted to have the sample visits selected by computer. The remaining sites selected sample visits through their staffs' maintenance of visit logs used to list every patient making a family planning visit. Individuals who answered "yes" to the screening question ("Are you here to see a health provider [physician, nurse, allied health personnel] about obtaining health services related to contraception, infertility treatment, or sterilization?") were listed consecutively on the visit log. Individuals whose names appeared on the last line of each page in the visit log were selected, and data for those visits were collected. Different versions of the family planning visit logs corresponded to each of the 14 sampling rates employed to select sample visits; the number of lines used to list patients on the family planning visit log was equal to the reciprocal of the sampling fraction used by the site.

Data processing.—Data processing differed according to the mode of data submission. Visit data received on Clinic Visit Records had to be keyed to machine-readable form before computer processing. Keying for all data items was independently verified for 100 percent of the Clinic Visit Records. Visit data received on a computer tape or on punched cards from a computerized record system did not require preprocessing.

All visit data, regardless of the form of data submission, were edited by NCHS for completeness and consistency. Visit records with errors, inconsistencies, or item nonresponse were corrected, if possible, through followup with the service site or the computerized record system. Imputation was used for specific data items when the overall level of nonresponse for an item was small.

Reliability of estimates

Estimation.—The survey statistics are derived by a complex estimation procedure used to produce essen-

Table I. Number of female family planning patients by age, race, ethnicity, and patient status: United States, 1980

Race, ethnicity, and patient status	Total	Age

¹All patients include races other than white and black.

tially unbiased data. The procedure's two principal components are inflation by the reciprocal of the probability of sample selection and adjustment for nonresponse.

Sampling error.—The statistics presented in this report are based on a sample survey and, therefore, differ from those that would be based on a full-count (100-percent) survey that used the same data collection definitions and procedures. The probability sampling design allows calculation of estimated standard errors from the sample data.

Table II. Relative standard error (in percent) of female patient estimates by age, race, ethnicity, and patient status: United States, 1980

The standard error is primarily a measure of the variability that occurs by chance because a sample rather than the entire sampling frame is surveyed. While the standard errors calculated for this report reflect some of the random variation inherent in the measurement process, they do not measure any systematic error, or bias, that is present in the data. One is referred to the section titled "Nonsampling error" for additional information on measurement error.

The chances are about 0.68 that the interval specified by the estimate plus or minus one standard

Table V. Relative standard error (in percent) of female patient estimates by education, race, ethnicity, and patient status: United States, 1980

Race, ethnicity, and patient status	Total	Education		
		Less than 12 years	12 years	13 years or more

¹All patients include races other than white and black.

error contains the figure that would be obtained through a full-count survey of the sampling frame. The chances are about 0.95 that the interval specified by the estimate plus or minus two standard errors contains the figure that would be obtained through a full-count survey of the sampling frame.

In order to derive standard errors at moderate cost that would be applicable to a wide variety of statistics, several approximations were required. It is necessary to utilize the estimates of domain sizes, relative standard errors, and sample sizes shown in tables I-IX.

Table IV. Number of female family planning patients by education, race, ethnicity, and patient status: United States, 1980

The standard error of proportion estimates may be approximated by use of the design effect approach. For data from the National Reporting System for Family Planning Services, the design effect varies with the size of the base of the proportion (see table X). With the selection of larger values in the range of recommended design effects, fewer comparisons of survey parameters will result in significant differences. The largest value in each range of recommended design effects was used to determine reliability for this report.

Table VIII. Relative standard error (in percent) of female patient estimates by income status, race, ethnicity, and patient status: United States, 1980

¹All patients include races other than white and black.

Accordingly, the standard error of an estimated proportion of patients is approximated by the following formula:

$$\text{Standard error } (p) = (\text{D.E.}) \sqrt{\frac{p(1-p)}{n}}$$

where

p = the estimated proportion.
 n = the number of sample (i.e., unweighted) patients in the base of the proportion (see table III).

D.E. = the design effect corresponding to the size of the estimated base of the proportion p (see table IV).

For example, 74.3 percent ($p = 0.743$) of the 1,703,000 teenage family planning patients continued or adopted use of the oral contraceptive pill. The following computation may be used to determine the standard error for this estimated proportion:

$$\text{Standard error} = 6 \sqrt{\frac{(0.743)(1-0.743)}{78,658}} = 0.009$$

where

$$\begin{aligned} p &= 0.743 \\ \text{D.E.} &= 6 \\ n &= 78,658 \end{aligned}$$

and

$$\text{relative standard error} = \frac{0.009}{0.743} = 0.012$$

Table X. Range of recommended design effects for proportion estimates

Estimated number of patients in base of proportion (domain size)	Range of recommended design effects	Design effect used in this report to determine reliability
Less than 1 million.....	1-5	5
1-3 million.....	2-6	6
More than 3 million.....	3-8	8

One may also wish to compute the standard error associated with national aggregate estimates. To calculate the approximate standard error of an aggregate estimate X , first compute the relative standard error (RSE) of the proportion (X/Y), where Y is the aggregate estimate for the smallest category of patients listed in table IA containing X population (e.g., if X is the estimated number of teenage family planning patients adopting or continuing use of the oral contraceptive pill, Y is the estimated number of teenage family planning patients).

Then

$$RSE(X) = \sqrt{(RSE(X/Y))^2 + (RSE(Y))^2}$$

and

$$\text{standard error}(X) = X RSE(X).$$

To continue with the example, one may calculate the standard error of the estimated 1,262,000 teenage family planning patients who continued or adopted use of the oral contraceptive pill.

First, the approximate relative standard error of the proportion estimate (the estimated proportion of teenage family planning patients who continued or adopted use of the pill) is calculated. This was determined to be 0.012. The relative standard error for the base of the proportion (i.e., the estimated total number of teenage family planning patients) is provided in table IB.

Therefore

$$RSE(1,262,000) = \sqrt{(0.012)^2 + (0.040)^2} = 0.042$$

The standard error is the aggregate estimate multiplied by the RSE:

$$\begin{aligned} \text{Standard error}(1,262,000) &= (0.042)(1,262,000) \\ &= 53,004 \end{aligned}$$

Nonsampling error.—The data presented in this report are also subject to nonsampling error, including that due to item nonresponse, information incompletely or inaccurately recorded, and processing error.

In addition, adjustment for service site nonresponse may introduce nonsampling error in the NRSFPS statistics. In particular, the 1980 NRSFPS was subject to Statewide nonresponse for several consecutive months, with several such States in a single geographic region. An adjustment for such nonresponse was made by means of a multiplicative factor to the basic sample visit weight for each responding sample service site. It is not known whether this results in over- or underestimation of the total number of patients.

During early 1980, the National Center for Health Statistics conducted a study to identify and measure nonsampling error associated with 1980 data from the National Reporting System for Family Planning Services.^a The study included site visits to 174 family planning facilities in the 1980 sample. The study revealed that it was not generally possible to verify the number of medical family planning visits. For example, service sites frequently did not differentiate between medical and nonmedical family planning visits. The study indicated patient totals are probably underestimated. Other problems associated with adherence to survey definitions and procedures were identified, and evidence suggests that patient data were not always updated in the site's record system at every visit.

Rounding.—Aggregate estimates of family planning patients are rounded to the nearest thousand; the percentages were computed based on unrounded estimates; and thus, the figures may not sum to the totals.

^aFinal Report of Data Quality Study for the National Reporting System for Family Planning Services, August 1980, Informatics. (Unpublished.)

Appendix II. Definitions of terms used in this report

Clinic.—See family planning service site.

Clinic Visit Record for Family Planning Services.—The National Center for Health Statistics primary data collection form used for the NRSFPS. See appendix III for facsimile.

Continuation patients.—All family planning patients who made a previous visit to any family planning service site during the last calendar year.

Contraception.—Conscious use by individuals of medication, devices, or practice that permit coitus with reduced likelihood of conception (commonly known as birth control).

Contraceptive method.—Any medical device or practice that permits coitus with reduced likelihood of conception.

Education.^a—The highest grade of “regular” school completed (not the highest grade entered). Regular school refers to any institution in which a person can earn credits toward an accredited elementary school certification, high school diploma, or college degree. Trade schools, beauty schools, business schools, and the like are excluded unless credits are granted toward an elementary school certification, high school diploma, or college degree.

Family planning patient.—A person who receives medical services related to contraception, sterilization, or infertility treatment in a family planning service site anywhere within the United States or its territories.

Family planning service site.—A location or site where family planning services are provided on a regular basis under the supervision of a physician. Private physicians’ offices and group medical practices are not considered sites unless they receive support through a Department of Health and Human Services grant for the provision of family planning services. Military service sites are excluded from the survey.

Family planning services.—Medical services that primarily are considered with the regulation of conception, that is, they enable a person either to reduce the risk of conception (contraceptive services) or to induce conception (infertility services) when desired.

Fetal deaths.—Death of a product of conception prior to the expulsion or extraction from its mother. This includes miscarriages, stillbirths, and induced abortions.

Hispanic origin or descent.—Individuals who consider themselves to be of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish origin or descent, regardless of race.

Infertility.—Diminished or absent ability to conceive.

Live births.—Children born alive any time after conception. In the event of multiple births, each child is counted as a birth. For example, twins count as two live births, and triplets count as three live births.

Medical services.—The provision of contraceptive methods as well as general physical examinations and other testing involved in maintaining the health of the patient. These include the following:

1. *Pap smear.*—Papanicolaou’s test to detect cervical cancer.
2. *Pelvic examination.*—Speculum examination of the vagina and bimanual examination of internal pelvic organs.
3. *Breast examination.*—Inspection and palpation of the breast and axillary glands.
4. *Blood pressure.*—Routine measurement of a patient’s blood pressure.
5. *Pregnancy testing.*—Any diagnostic test performed to determine pregnancy.
6. *V.D. Testing.*—Test to detect the presence of venereal disease.
7. *Urinalysis (N.E.S.).*^b—Any test done on a patient’s urine sample other than for pregnancy or venereal disease.
8. *Blood test (N.E.S.).*^b—Any test of a patient’s blood except for venereal disease or pregnancy.
9. *Other medical services.*—Medical family planning services not specified on the Clinic Visit Record

^bN.E.S.—Not elsewhere specified.

for Family Planning Services. Examples include X-rays and immunizations.

New patients.—All patients whose first family planning visit (i.e., initial visit) to a family planning service site occurred during the survey year. (This does not preclude the individual's having made a visit to a private physician.)

Public assistance income.—The patient's family in-

come from any Federal, State, or local public assistance program (for example, aid for dependent children and general assistance). Scholarships, education grants, unemployment benefits, and Social Security pensions are not considered public assistance income.

Readmission patient.—A family planning patient whose last visit to any family planning service site occurred one or more years before the survey year.

Vital and Health Statistics series descriptions

- SERIES 1. **Programs and Collection Procedures.**—Reports describing the general programs of the National Center for Health Statistics and its offices and divisions and the data collection methods used. They also include definitions and other material necessary for understanding the data.
- SERIES 2. **Data Evaluation and Methods Research.**—Studies of new statistical methodology including experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory.
- SERIES 3. **Analytical and Epidemiological Studies.**—Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
- SERIES 4. **Documents and Committee Reports.**—Final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
- SERIES 10. **Data From the National Health Interview Survey.**—Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, all based on data collected in the continuing national household interview survey.
- SERIES 11. **Data From the National Health Examination Survey and the National Health and Nutrition Examination Survey.**—Data from direct examination, testing, and measurement of national samples of the civilian noninstitutionalized population provide the basis for (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.
- SERIES 12. **Data From the Institutionalized Population Surveys.**—Discontinued in 1975. Reports from these surveys are included in Series 13.
- SERIES 13. **Data on Health Resources Utilization.**—Statistics on the utilization of health manpower and facilities providing long-term care, ambulatory care, hospital care, and family planning services.
- SERIES 14. **Data on Health Resources: Manpower and Facilities.**—Statistics on the numbers, geographic distribution, and characteristics of health resources including physicians, dentists, nurses, other health occupations, hospitals, nursing homes, and outpatient facilities.
- SERIES 15. **Data From Special Surveys.**—Statistics on health and health-related topics collected in special surveys that are not a part of the continuing data systems of the National Center for Health Statistics.
- SERIES 20. **Data on Mortality.**—Various statistics on mortality other than as included in regular annual or monthly reports. Special analyses by cause of death, age, and other demographic variables; geographic and time series analyses; and statistics on characteristics of deaths not available from the vital records based on sample surveys of those records.
- SERIES 21. **Data on Natality, Marriage, and Divorce.**—Various statistics on natality, marriage, and divorce other than as included in regular annual or monthly reports. Special analyses by demographic variables; geographic and time series analyses; studies of fertility; and statistics on characteristics of births not available from the vital records based on sample surveys of those records.
- SERIES 22. **Data From the National Monthly and Natality Surveys.**—Discontinued in 1975. Reports from these sample surveys based on vital records are included in Series 20 and 21, respectively.
- SERIES 23. **Data From the National Survey of Family Growth.**—Statistics on fertility, family formation and dissolution, family planning, and related maternal and infant health topics derived from a periodic survey of a nationwide probability sample of ever-married women 15–44 years of age.
