

1993 TEENAGE ATTITUDES AND PRACTICES SURVEY  
PUBLIC USE DATA TAPE

Introduction

The Teenage Attitudes and Practices Survey (TAPS) is a follow-up study to the National Health Interview Survey (NHIS). The first TAPS (TAPSI) was conducted in 1989 and the second TAPS (TAPSII) was conducted in 1993. The TAPSII sample had two components.

The first TAPSII sample component is a follow-up of the TAPSI telephone sample and was comprised of persons aged 12-18 years on November 1, 1989. Primary data collection for TAPSI was by telephone and secondary data collection by a mail questionnaire. Data were collected by telephone for about 75 percent of the TAPSI sample. Those respondents completing a mail questionnaire were administered an abbreviated interview and were not considered for follow-up in TAPSII. A relatively small part of the TAPS target population resides in nontelephone households and thus, the bias in TAPS estimates due to undercoverage of the nontelephone population is expected to be small.

Respondents for TAPSII included the 9,135 teenagers who responded by telephone to TAPSI (aged 15-22 years at the time of TAPSII), and 5,590 new adolescents aged 10-15 years who were drawn from quarters three and four of the 1991 NHIS and quarter one of the 1992 NHIS sample frames.

The primary method of data collection in TAPSII was Computer Assisted Telephone Interviewing (CATI). Persons in the sample who could not be contacted by telephone were contacted in person. In each TAPSII sample component, all persons eligible in a household were selected for the TAPSII sample. Black persons were oversampled in the TAPSII.

Tape locations 1-67 are selected information from the NHIS person record from the core questionnaire. Weights occupy locations 68-88. For most analytical purposes location 82-88 "Final Basic Weight" should be used. TAPSII questionnaire data are located in tape locations 100-714 and TAPSI data collected on TAPSII respondents may be found in locations 715-885.

Tape locations 36-58 have an asterisk after the item name with the following explanation at the bottom of the page: "This variable must be used in conjunction with tape location 17 because data was collected during two different time periods. See the survey description for complete details." This qualification is necessary since updated sociodemographic information was not gathered on those teenagers followed-up from the 1989 TAPS. Therefore, tape location 17, "Type of TAPS II Sample Person", (1=1988-1989 NHIS sample person and 2=1991-1992 NHIS sample person) must be included when using socio-demographic variables.

1

1Definitions of Smoking Status

Modified NHIS Smoking Status:

Never smoked: Never smoked 100 cigarettes in life

Current smoker: Smoked 100 cigarettes in life and smoked 1-30 days in the

past 30 days.

Former smoker: Smoked 100 cigarettes in life but has not smoked in the past 30 days.

Smoker, DK status: Smoked 100 cigarettes in life but unknown if smoked in past 30 days

#### Adolescent Smoking Status:

Never smoked, DK type: Never smoked a cigarette, never tried or experimented with cigarettes, unknown if they will try a cigarette soon and/or unknown if they will be smoking one year from the time of the interview.

Never smoked, no intention: Never smoked, never experimented, will not try a cigarette soon, and will definitely not be smoking one year from the time of the interview.

Never smoker, contemplator: Never smoked, never experimented, may try a cigarette soon and/or may be smoking a year from the time of the interview.

Current regular smoker, light: Smoked 10-30 days in the past 30 and smoked less than five cigarettes each day.

Current regular smoker, heavy: Smoked 10-30 days in the past 30 and smoked five or more cigarettes each day.

Current occasional smoker: Smoked 1-9 days in the past 30.

Current regular smoker, DK type: Smoked 10-30 days in the past 30 and number of cigarettes smoked each day is unknown.

Experimenter: Smoked or tried a cigarette but has not smoked 100 cigarettes and has not smoked in the past 30 days.

Former smoker: Smoked 100 or more cigarettes but has not smoked in the past 30 days.

#### Weights and Variances

Since the NHIS uses a multistage sample design to represent the civilian non-institutionalized population of the United States, data from the NHIS TAPSII should be weighted for analysis.

There are a number of computer programs that yield variance estimates for data based on complex sample surveys. Some are based on replication approaches and others are based on Taylor linearization approaches.

To permit the analyst the capability of using such variance estimation procedures, included on the file for these two estimators are the interim weights (tape locations 68-74), which is the weight prior to poststratification, substratum identifier (tape location 66, (SUB)), full sample stratum identifier (60-62, (STRATUM)), pseudo primary sampling unit (PSU) codes (tape locations 63-64, (CSTRATUM) and 65, (CPSU)), and Type of PSU (tape location 67).

In the TAPS the poststrata were defined by race (Black and non-Black), sex (male and female), and age categories (10-14 years, 15-17 years, 18-19 years, and 20-22 years). These variables and weights are necessary for directly calculating sampling variances.

#### Limitations of Data

Estimates of smoking prevalence based on TAPSI as well as those based on TAPSII are comparable to some other national surveys and lower than others.<sup>1/</sup> These variations may be explained by differences in survey populations, definitions, survey methodology, and data collection procedures. Because data for TAPSII was collected by Computer-Assisted Telephone Interviews (CATI), privacy issues should be considered when interpreting the data. Younger persons may be fearful of disclosing smoking behavior when a parent is in the household and CATI methods are unable to control for who is in the household during the interview. Further, CATI does not afford the same opportunity as in-person interviews for building respondent-interviewer rapport. This is particularly important when sensitive data, such as an adolescent's smoking behavior, is sought.

Analysis of the original TAPSI sample by smoking status at the time of the 1989 interview revealed that youth who were successfully followed-up in TAPSII were less likely to have reported smoking than those who could not be reinterviewed, i.e. nonrespondents. Further TAPSI respondents who resided in nontelephone households (that is, were not eligible for the TAPSII interview) may have been more likely to be smokers. For these reasons, prevalence estimates from TAPSII may be lower than they would have been had the entire TAPSI cohort been successfully reinterviewed and therefore, should be interpreted with caution.

#### Response Rates

The completion rate for the TAPSII was high. Of the 9,135 cases fielded in the follow-up component, 87 percent (7,960) responded. For the 5,590 new TAPSII persons, 4,992 (89 percent) responded.

This difference may partially be explained by the lower response rate among older youth, who are more likely to be smokers. Further, young adults are more likely to have moved between the TAPSI and TAPSII interviews and thus, some of the nonresponse could be associated with difficulties in tracking and locating these individuals.

The overall response rate for the follow-up group is 62 percent {95% (NHIS completion rate) x 75% (TAPSI telephone completion rate) x 87% (TAPS II completion rate for the followed-up TAPSI telephone sample)}. The overall response rate for the new TAPSII sample is 85 percent {95% (NHIS completion rate) x 89% (TAPSII completion rate for other than the followed-up TAPSI telephone sample)}.
