Objectives

This report presents U.S. and State-level data on births, birth rates, and fertility rates for Hispanic origin subgroups for 1990 and 2000. Data for non-Hispanic whites and non-Hispanic blacks are provided for comparison.

Methods

Data are presented in detailed tables, graphs, and maps.

Results

Between 1990 and 2000, the total U.S. Hispanic population increased 58 percent, from 22,353,999 to 35,305,818. Over the same period of time, births to Hispanic mothers increased 37 percent, from 595,073 to 815,868. The smaller increases in births compared with the population resulted in a falling birth rate among Hispanic mothers (26.7 in 1990 to 23.1 births per 1,000 total population in 2000). Birth and fertility rates for Mexican, Puerto Rican, and Cuban mothers all fell between 1990 and 2000. Among the Hispanic subgroups, fertility rates in 2000 ranged from 105.1 births per 1,000 women aged 15–44 years for Mexican women to 49.3 for Cuban women. Differences in fertility exist not only between Hispanic subgroups but also within groups among States. For example, total fertility rates for Puerto Rican mothers, which estimates the number of children a group of 1,000 women will have in their lifetime, ranged in 2000 from 1,616.5 in New York to 2,403.0 in Pennsylvania.

Birth and Fertility Rates for States by Hispanic Origin Subgroups: United States, 1990 and 2000

by *Paul D. Sutton, Ph.D., and T.J. Mathews, M.S.*
Division of Vital Statistics

Introduction

This report presents 1990 and 2000 births, birth rates, and fertility rates for the United States, each State, and the District of Columbia. This report shows the considerable variation in birth and fertility rates among Hispanic groups and across States. A number of demographic, socioeconomic, and behavioral factors contribute to this variation; however, the report does not try to provide an explanation of the variation. Rather, the description of the variation and trends that exist between groups and among States is aimed at enriching discussions of Hispanic fertility.

The Hispanic population continues to be the fastest growing group within the United States, reflecting both immigration and the overall higher fertility levels of Hispanics (Table A). Although births to Hispanic women increased 37 percent between 1990 and 2000 and another 12 percent between 2000 and 2003, increases in some States were much larger than in others (Table B). National birth and fertility rates and counts of births by State for

Hispanic subgroups are published annually (1). Detailed rates for Hispanic subgroups by State can only be computed in census years because reliable intercensal population estimates for Hispanic subgroups by State are not available. The detailed rates presented in this report (Tables 1–3) use populations by age, sex, race, and Hispanic subgroup derived from the 1990 and 2000 decennial census (2–4). The rates presented in this report are the crude birth rate, general fertility rate, age-specific birth rate, total fertility rate, and first birth rate (for definitions, see “Measures of Fertility”). Birth and fertility rates for States by Hispanic origin for 1990, 1995, and 2000–2002 and for Hispanic subgroups by State in 1990 have been published in earlier reports (5,6). Information for non-Hispanic white and non-Hispanic black is provided for comparison.

Tables 1–3 present 1990 and 2000 data by Hispanic origin and Hispanic subgroups and for non-Hispanic white and non-Hispanic black. Table 1 contains the number of live births, birth rate, fertility rate, and total fertility rates. Table 2 contains age-specific birth rates and the total fertility rate. Table 3 shows first birth rates by age of mother.

This report was prepared under the general direction of Charles J. Rothwell, Director, Division of Vital Statistics (DVS), and Stephanie J. Ventura, Chief of the Reproductive Statistics Branch (RSB) of DVS. Ann Irvine and Martha L. Munson of RSB provided content review. This report was edited by Demarius V. Miller and typeset by Jacqueline M. Davis, and graphics were produced by NOVA contractor Kyung Park, of the Office of Information Services, Information Design and Publishing Staff.

²Includes races other than white and black.
³Fertility rate includes origin not stated.
⁴New Hampshire and Oklahoma did not report Hispanic origin in 1990 and are excluded from the 1990 figures.

Data illustrated in the maps and charts (Figures 1–17) are largely based on the tabular data in this report.

Sources and Methods

Birth data shown in this report are based on 100 percent of the birth certificates registered in all States and the District of Columbia. More than 99 percent of births occurring in the United States are registered (7). The data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). VSCP includes all States, the District of Columbia, and the territories. Data for the territories are not shown in this report because of the large amount of data that are unavailable.

This report presents detailed tabulations of births, birth rates, and fertility rates by Hispanic origin of mother and by place of residence. Information for non-Hispanic white and non-Hispanic black is provided for comparison. In tables, race and Hispanic origin are presented in eight categories: total Hispanic, Mexican, Puerto Rican, Cuban, other Hispanic (primarily Central and South American, see “[Technical Notes](#)”), total non-Hispanic, non-Hispanic white, and non-Hispanic black. Although all tabulations are by race and Hispanic origin of the mother, text references to Mexican births and

Mexican mothers or non-Hispanic white births and non-Hispanic white mothers are used interchangeably for ease in writing. Tables do not show rates for States or subgroups with fewer than 20 births or fewer than 1,000 women in the specified population.

Rates for 2000 may differ from those published in “Births: Final Data for 2001” (8) and earlier reports, but they are consistent with those published in “Revised Birth and Fertility Rates for the 1990s and New Rates for the Hispanic Populations, 2000 and 2001: United States” (9) and other more recent reports. U.S. and State-level birth and fertility rates for 2000 are computed using populations that were produced under a cooperative agreement with the U.S. Census Bureau and are based on counts from the 2000 census (4). The 2000 and 1990 populations used to compute the birth and fertility rates shown in this report are presented in [Tables 4](#) and [5](#).

The 2000 census included an option for individuals to report more than one race as appropriate for themselves and household members, in accordance with the 1997 Office of Management and Budget (OMB) guidelines (10); see “[Technical Notes](#).” Birth certificates in 2000 only collected one race for the mother in the same categories, as specified in the 1977 OMB guidelines. Birth data by race (the numerators for birth rates) are thus currently incompatible with the population data

collected in the 2000 census (denominators by race). To produce birth rates for 2000, it was necessary to “bridge” the reported population data for multiple-race persons back to single-race categories. The procedures used to produce the “bridged” populations are described elsewhere (11,12).

Measures of Fertility

The *crude birth rate*, often simply referred to as the birth rate, relates the number of births to the total population residing in the area. The birth rate is expressed as the total number of live births per 1,000 population, without regard to the age or sex distribution of the population. For example, the birth rate of 26.8 for Hispanic mothers in Arizona ([Table 1](#)), in 2000, means that for every 1,000 residents of that State, there were 26.8 births.

The primary use of the birth rate is to indicate the contribution of births to the growth of the population area. It is limited as an analytical tool when comparing fertility levels among areas because these comparisons are affected by differences in the demographic composition of the population. Measures of fertility that take into account such differences from one population to another are more useful for most interarea and intergroup comparisons of fertility.

--- Data not available.

¹New Hampshire and Oklahoma did not report Hispanic origin in 1990 and are excluded from the 1990 figures.

The *general fertility rate*, frequently referred to as the fertility rate, is one of the most common measures of fertility. It relates the total number of births in an area to women 15–44 years of

age—those most likely to give birth. The fertility rate is the number of live births per 1,000 women in that age group. For example, the fertility rate of 113.3 for Hispanic mothers in Arizona

(Table 1) indicates that in 2000 there were 113.3 births per 1,000 women aged 15–44 years residing in that State.

The fertility rate controls for differences among areas in the

proportion of women of childbearing age in the population. However, differences in the age distribution within the childbearing years can influence the level of this rate, just as differences in the age-sex composition of the total population can affect the crude birth rate.

Age-specific birth rates relate the number of births to mothers of a given age group to the female population of that age group. In this report, the rates are expressed as the number of births to mothers in an age group per 1,000 women in that age group. For example, the rate of 196.1 for Hispanic women aged 20–24 years in Arizona (Table 2) means that in 2000 there were 196.1 births per 1,000 women 20–24 years of age residing in Arizona. In this report, birth rates for women aged 15–17 and 18–19 years are computed as well as rates for 5-year age groups 10–14 through 45–49 years.

The *total fertility rate* (TFR) summarizes a set of age-specific birth rates for the entire childbearing span. TFR is computed as the sum of the age-specific birth rates for 5-year age groups 10–14 through 45–49, each multiplied by 5. It is an age-adjusted rate because it is based on the assumption that there are the same number of women (1,000) in each 5-year age group. Therefore, it controls for differences among areas in the distribution of women within the childbearing years. The 2000 TFR for a specified area indicates the number of children 1,000 women would bear if they experienced the 2000 age-specific birth rates throughout their childbearing period (10–49 years). For example, the rate of 3,141.0 for Hispanic mothers in Arizona (Tables 1 and 2) means that if 1,000 women were to have the same birth rates at each 5-year age period that were observed for Hispanic women in Arizona in 2000, these women would bear a total of 3,141 children by the time they reached the end of their childbearing years. TFRs were only computed for subgroups that had at least 1,000 births and 2,500 women aged 15–44 years in the population.

TFR reflects the combined childbearing experience of women of all ages in a given year. It therefore can be interpreted as representing the implications of current levels of fertility for completed family size. TFR also can be used to judge if replacement level fertility has been reached. This is the level of fertility required for a population to exactly replace itself under projected mortality rates and in the absence of migration. In the United States this level is about 2,100. A TFR of less than 2,100 for an area is an indication that current fertility is below the level needed for long-term population replacement.

Order-specific birth rates are another useful method for analyzing fertility. The first birth rate, for example, provides a measure of the rate of family formation. Live-birth order refers to the number of children born alive to the mother, including the present birth. The order-specific birth rate for an area relates the number of births of a given live-birth order to the number of women aged 15–44 years residing in the area.

When computing order-specific rates, births of unknown order are proportionately distributed according to births of known order. The rate of 41.3 for first births of Hispanic mothers in Arizona (Table 3) means that there were 41.3 first births for every 1,000 Hispanic women 15–44 years of age residing in that State.

Results

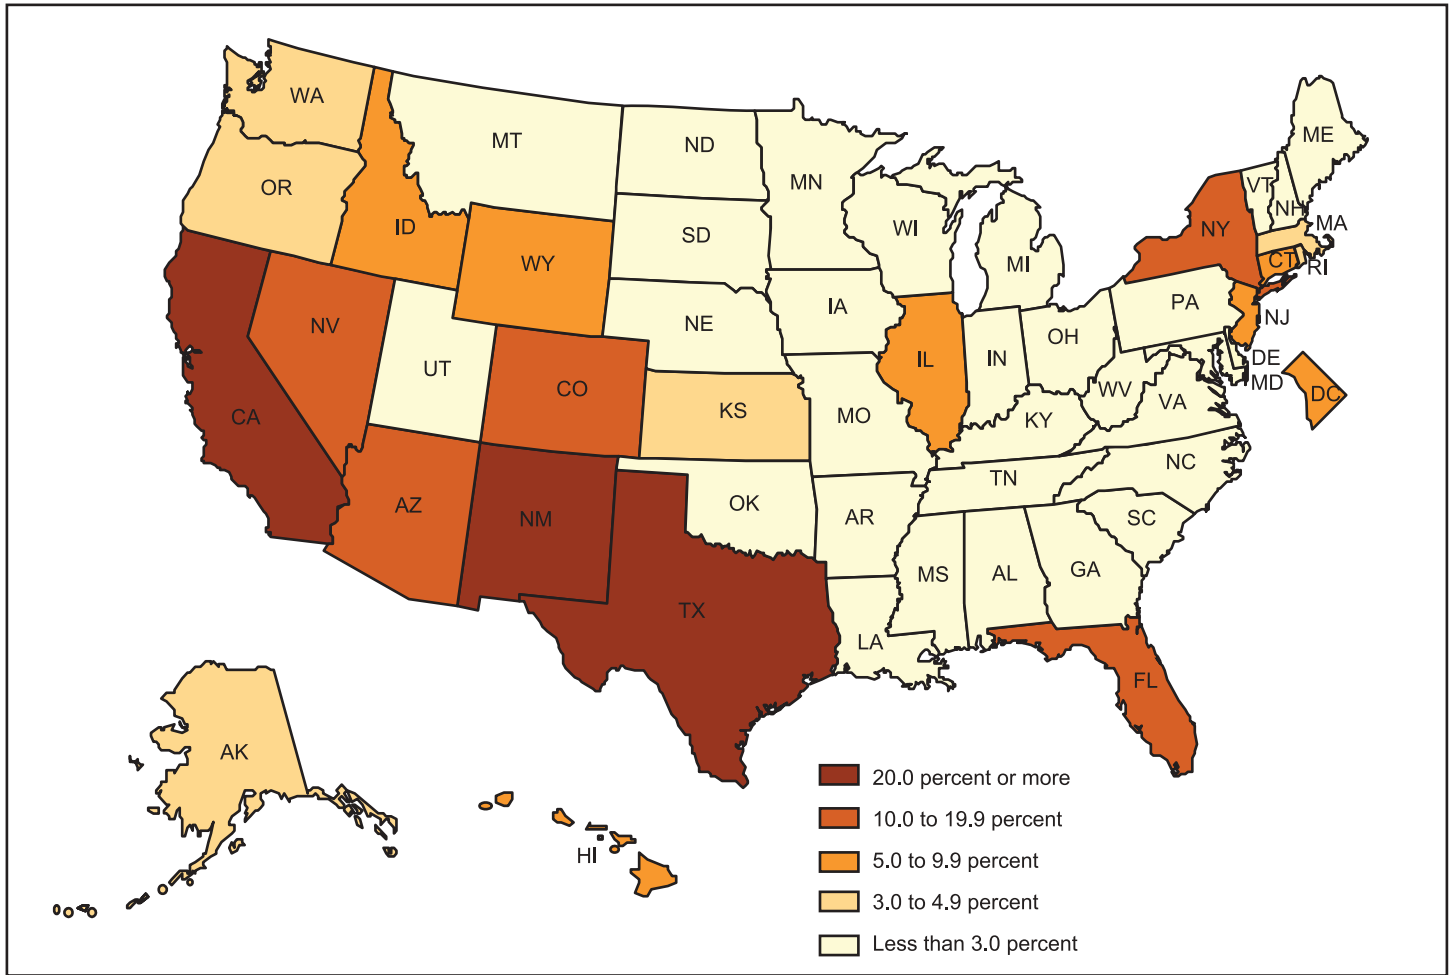

Figure 1. Population of Hispanic origin as a percentage of total population: 1990

In 1990, Hispanics were 9 percent of the total U.S. population. By State, the percentage of the population that was Hispanic varied widely from less than 1 percent in Alabama, Arkansas, Kentucky, Maine, Mississippi, North

Dakota, South Carolina, South Dakota, Tennessee, Vermont, and West Virginia to over 20 percent in California, New Mexico, and Texas. Most States with large Hispanic populations relative to their total population in 1990 were

found in the Southwest and West. However, New York and Florida were notable exceptions to this pattern, each having a population over 10 percent Hispanic.

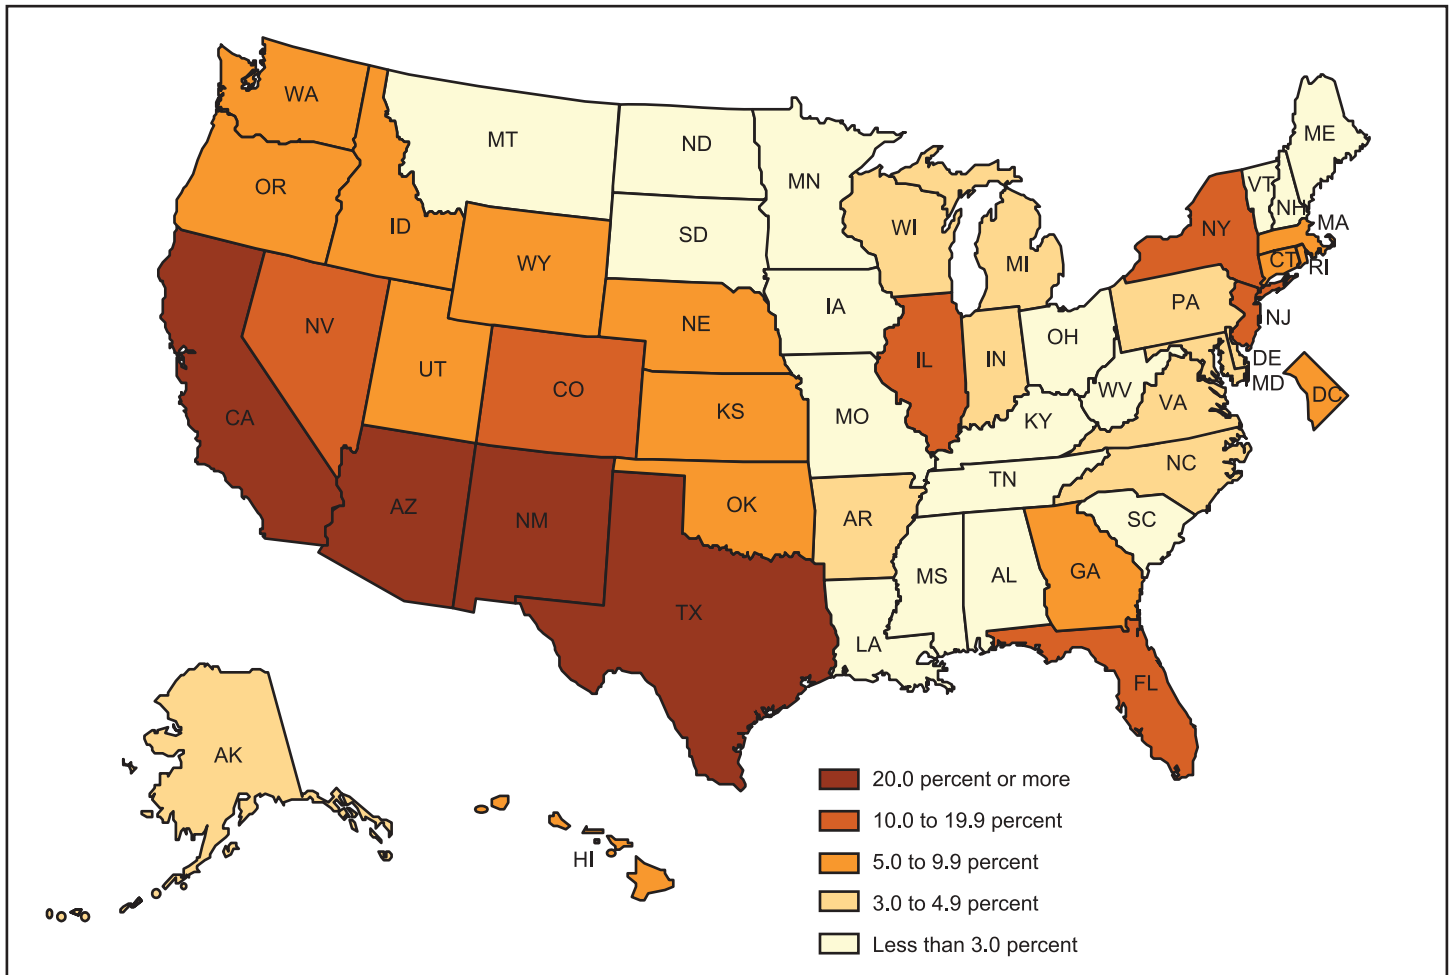

Figure 2. Population of Hispanic origin as a percentage of total population: 2000

By 2000, the total U.S. population was 13 percent Hispanic (up from 22.4 to 35.3 million). States in which Hispanics make up the largest proportion of the population were still in the Southwest and West. However,

growth of the Hispanic population was most rapid in the Southeast, with the expansion of North Carolina's Hispanic population leading the way, nearly quadrupling from 1.2 to 4.7 percent of total population between 1990 and 2000.

In fact, the seven States with the most rapidly growing Hispanic population, as a proportion of the total population, were all in the Southeast: North Carolina, Arkansas, Tennessee, Georgia, Alabama, South Carolina, and Kentucky.

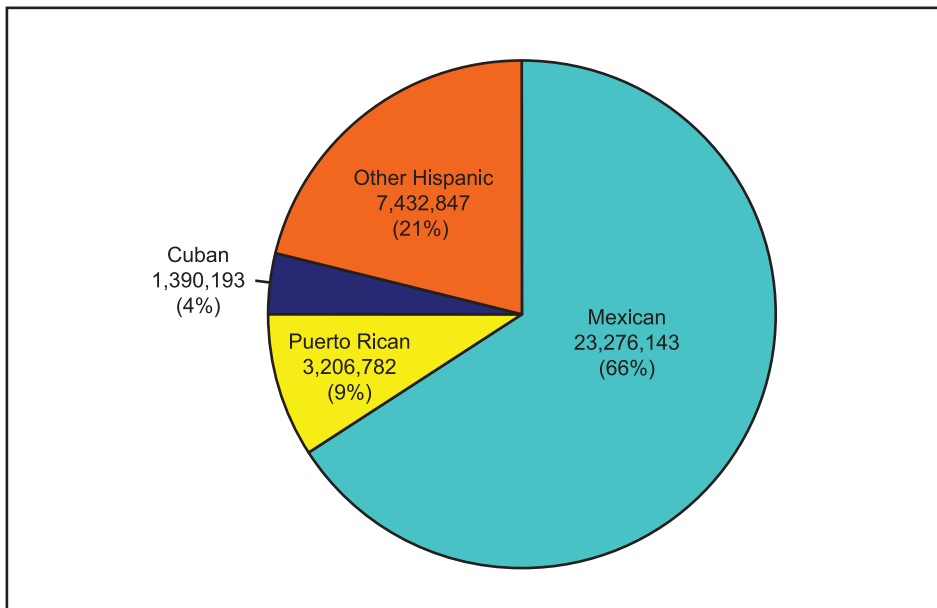

Figure 3. Population of Hispanic origin by subgroup: United States, 2000

The Hispanic population is relatively diverse. The largest Hispanic group in the United States is Mexican, which makes up 66 percent of all Hispanics. Puerto Rican makes up 9 percent of the Hispanic population,

and Cuban makes up 4 percent. A significant proportion, 21 percent, is in the group other Hispanic, which consists primarily of persons of Central and South American decent.

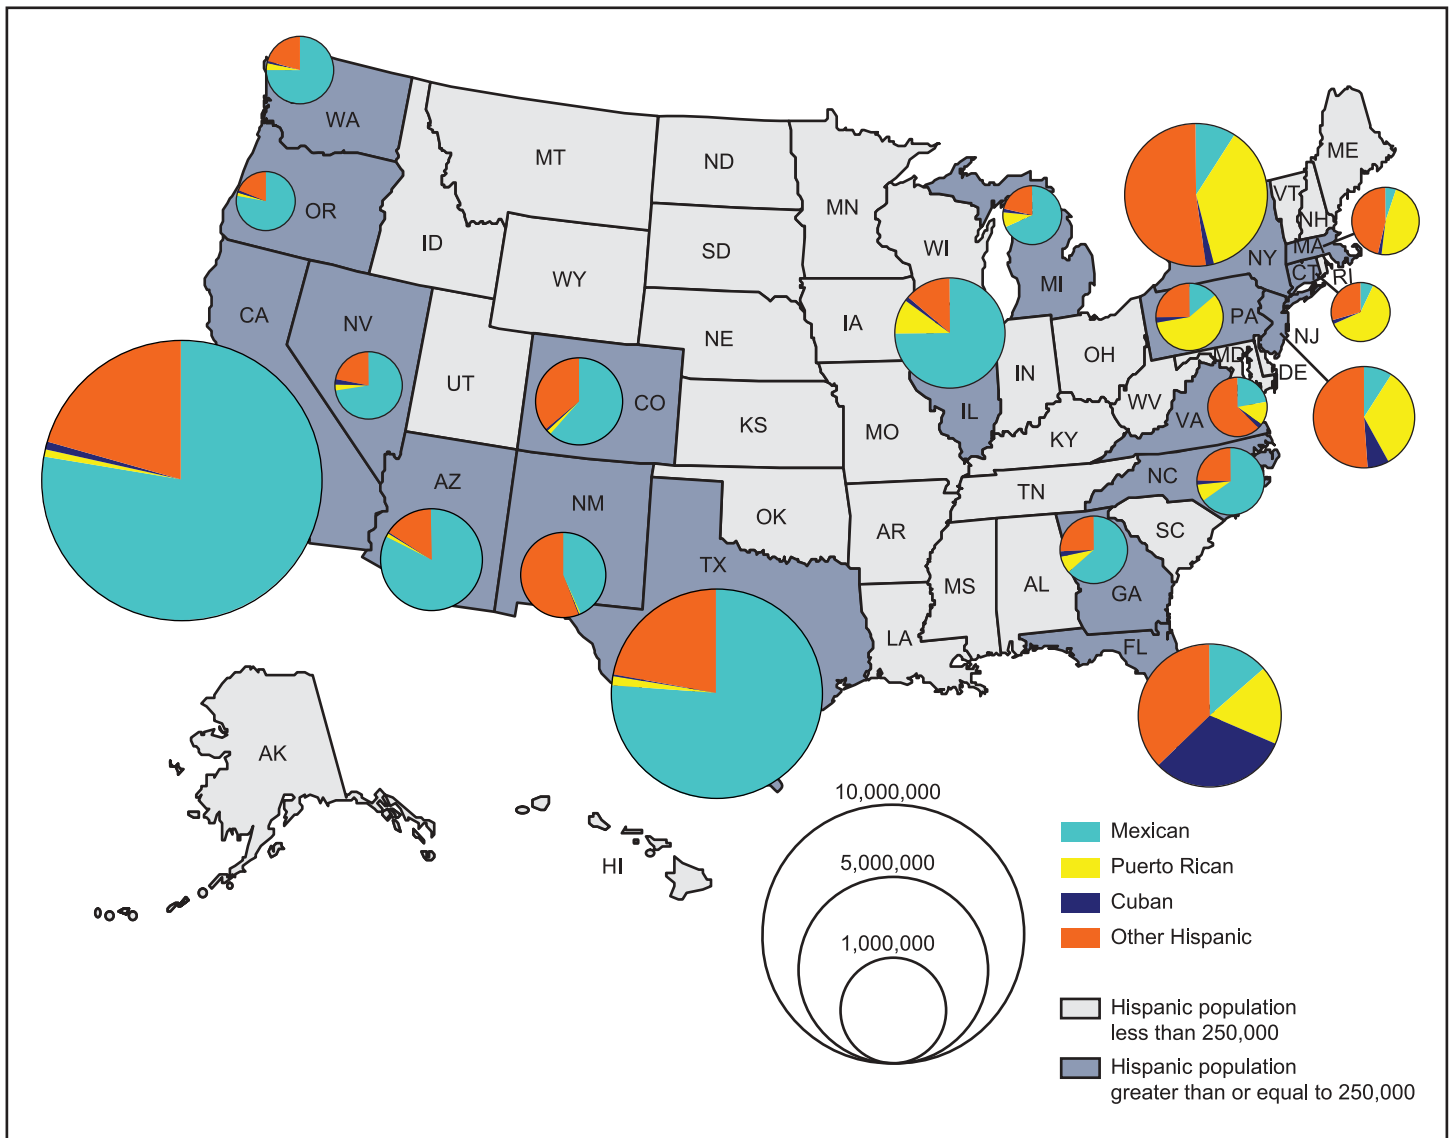

Figure 4. Population of Hispanic origin and subgroups: 2000

The actual size and composition of the Hispanic population varies considerably from State to State. In terms of absolute numbers, California has the largest Hispanic population with nearly 11 million Hispanics in 2000. Of these 11 million, 77 percent or 8.5 million are Mexican, 1 percent are Puerto Rican, less than 1 percent are Cuban, and 21 percent are other

Hispanic. Texas has the next largest Hispanic population with 6.7 million and a distribution very similar to that of California. New York and Florida follow with 2.9 and 2.7 million, respectively; however, these two States differ dramatically in the composition of their Hispanic population. New York's distribution is similar to other States in the Northeastern United States, with a

relatively small Mexican population (9 percent), large Puerto Rican population (37 percent), modest Cuban population (2 percent), and large other Hispanic (52 percent). Florida is unique with its very large Cuban population relative to other States, representing 31 percent of Hispanics in Florida and nearly two-thirds of all Cubans in the United States.

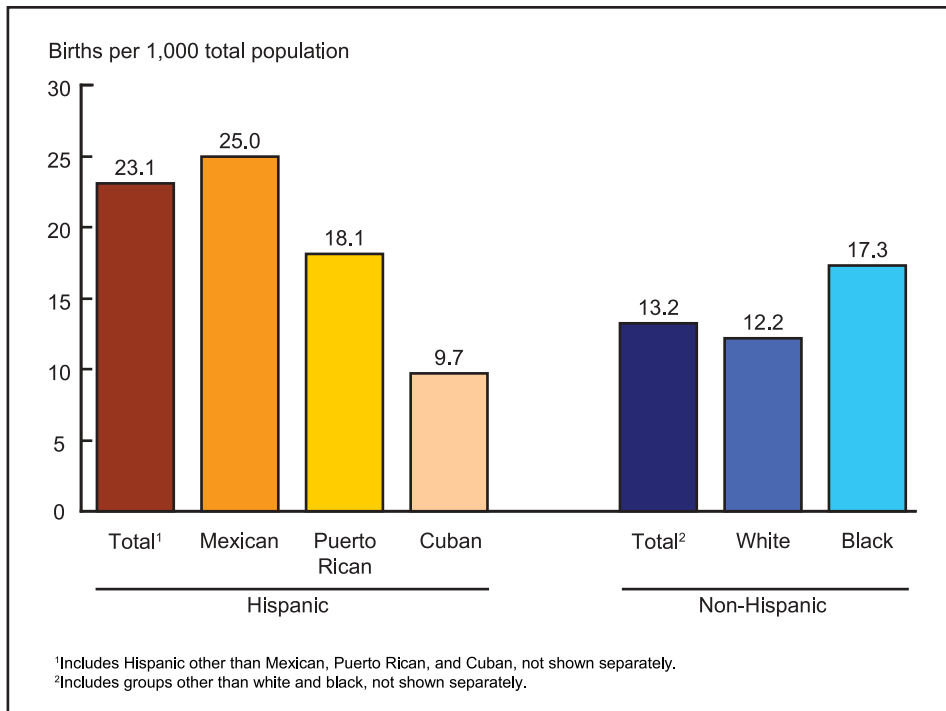

Figure 5. Birth rate: United States, 2000

Birth rates vary among race and Hispanic origin groups. Although birth rates for the Hispanic population are considerably higher than for non-Hispanics, most of the difference is attributable to much higher birth rates

for Mexicans. The birth rate for Cubans is lower than that of non-Hispanic white and non-Hispanic black, and the Puerto Rican birth rate is comparable to the rate for non-Hispanic black.

Age structure is one (but not the only) factor contributing to observed differences in birth rates among Hispanic subgroups. Populations with large proportions of their population in the childbearing years will tend to have higher birth rates. The Mexican population is a good example of this, with 21 percent of the total population in their twenties, when birth rates tend to be their highest. By comparison, 18 percent of Puerto Ricans are in their twenties, and just 12 percent of Cubans.

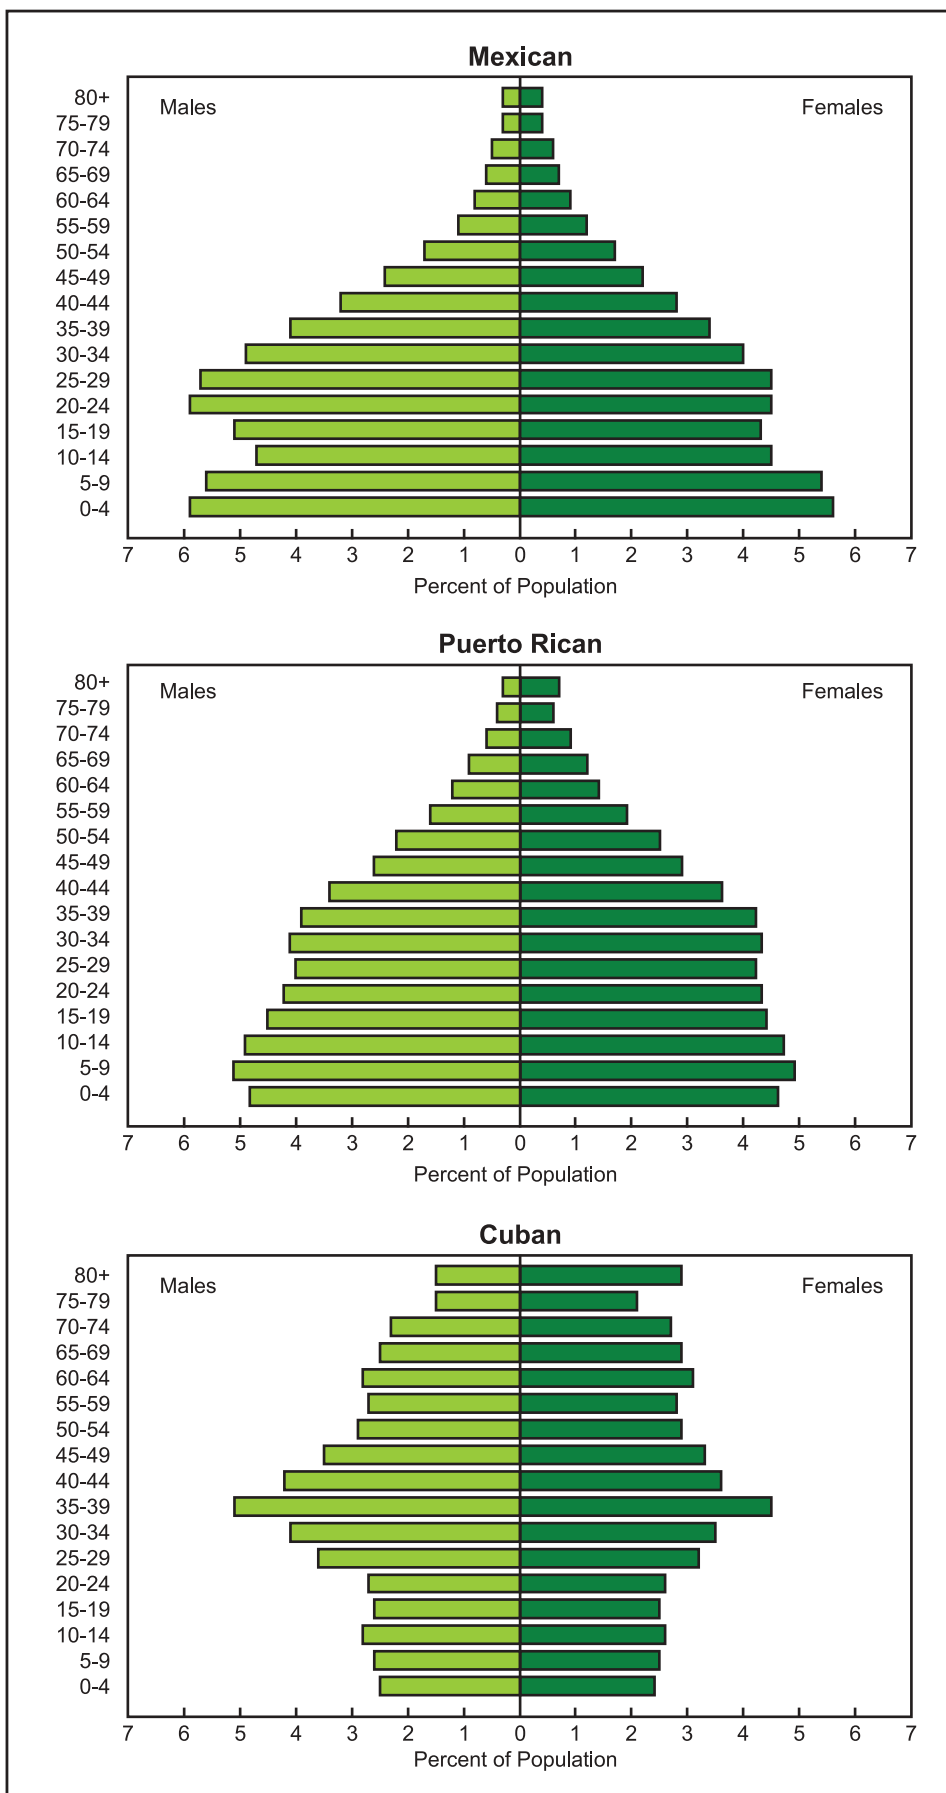

Figure 6. Mexican, Puerto Rican, and Cuban populations by age and sex: United States, 2000

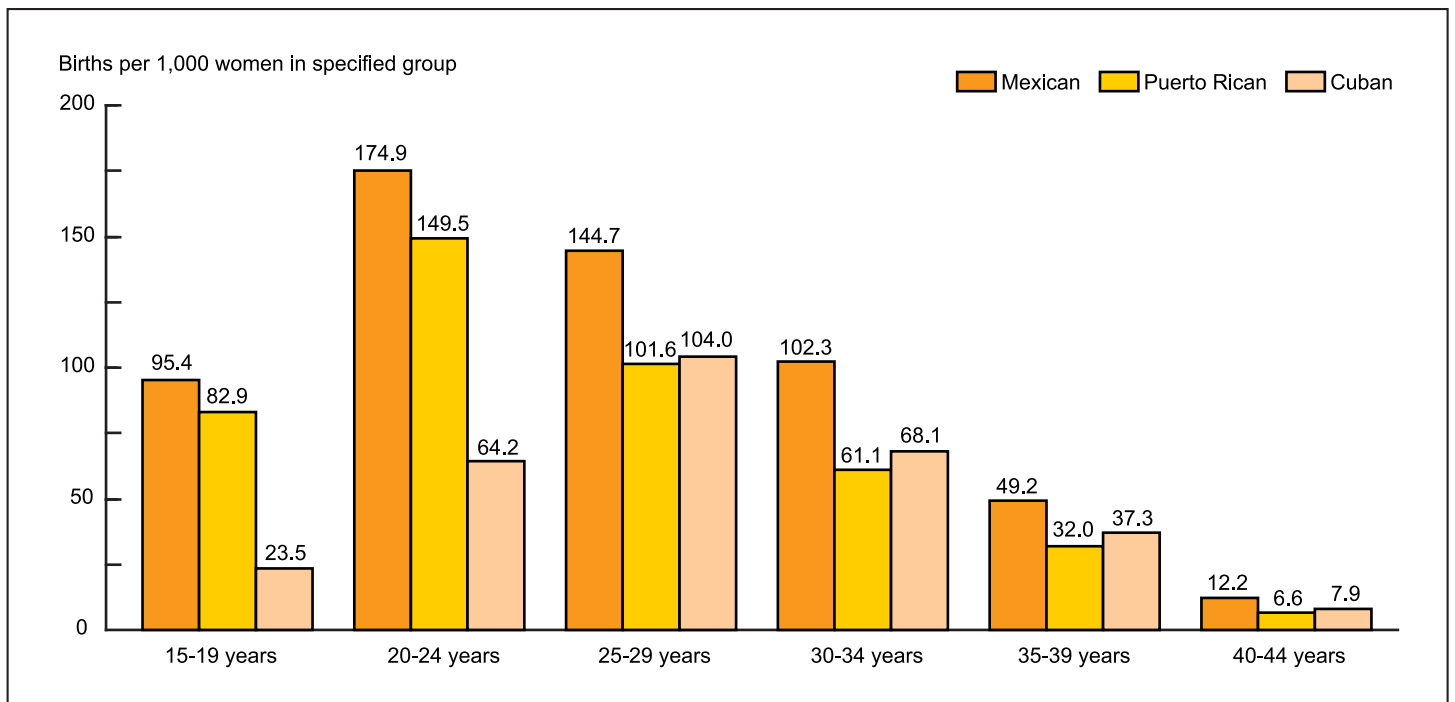

Figure 7. Age-specific birth rates for Mexican, Puerto Rican, and Cuban women: United States, 2000

Mexicans, when compared with Puerto Ricans and Cubans, had the highest age-specific birth rates in each age group. For Mexicans and Puerto

Ricans, the highest age-specific birth rate was for women aged 20–24 years, whereas for Cubans the highest rate was for women aged 25–29 years.

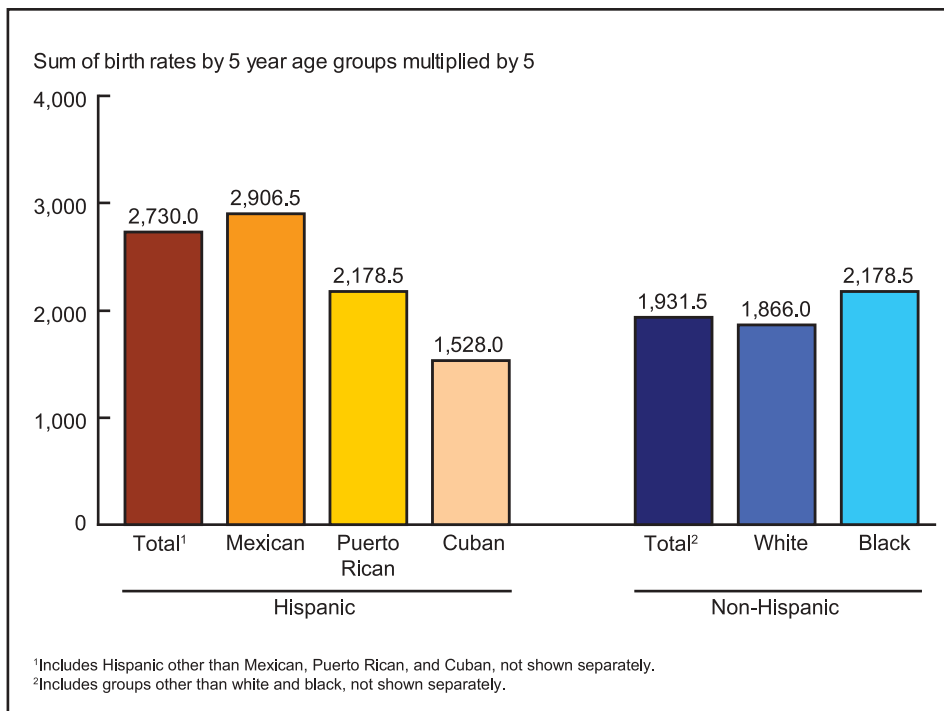

Figure 8. Total fertility rate: United States, 2000

Difference in fertility among Hispanic groups persists even when the effect of the populations' sex and age composition is controlled. Total fertility rates adjust for different age structures by providing an indicator of how many children a hypothetical cohort of 1,000

women would have in their life given current age-specific birth rates. Fertility rates for Mexican women continue to be much higher than for any other group, reflecting the higher birth rates for Mexican women in every age group.

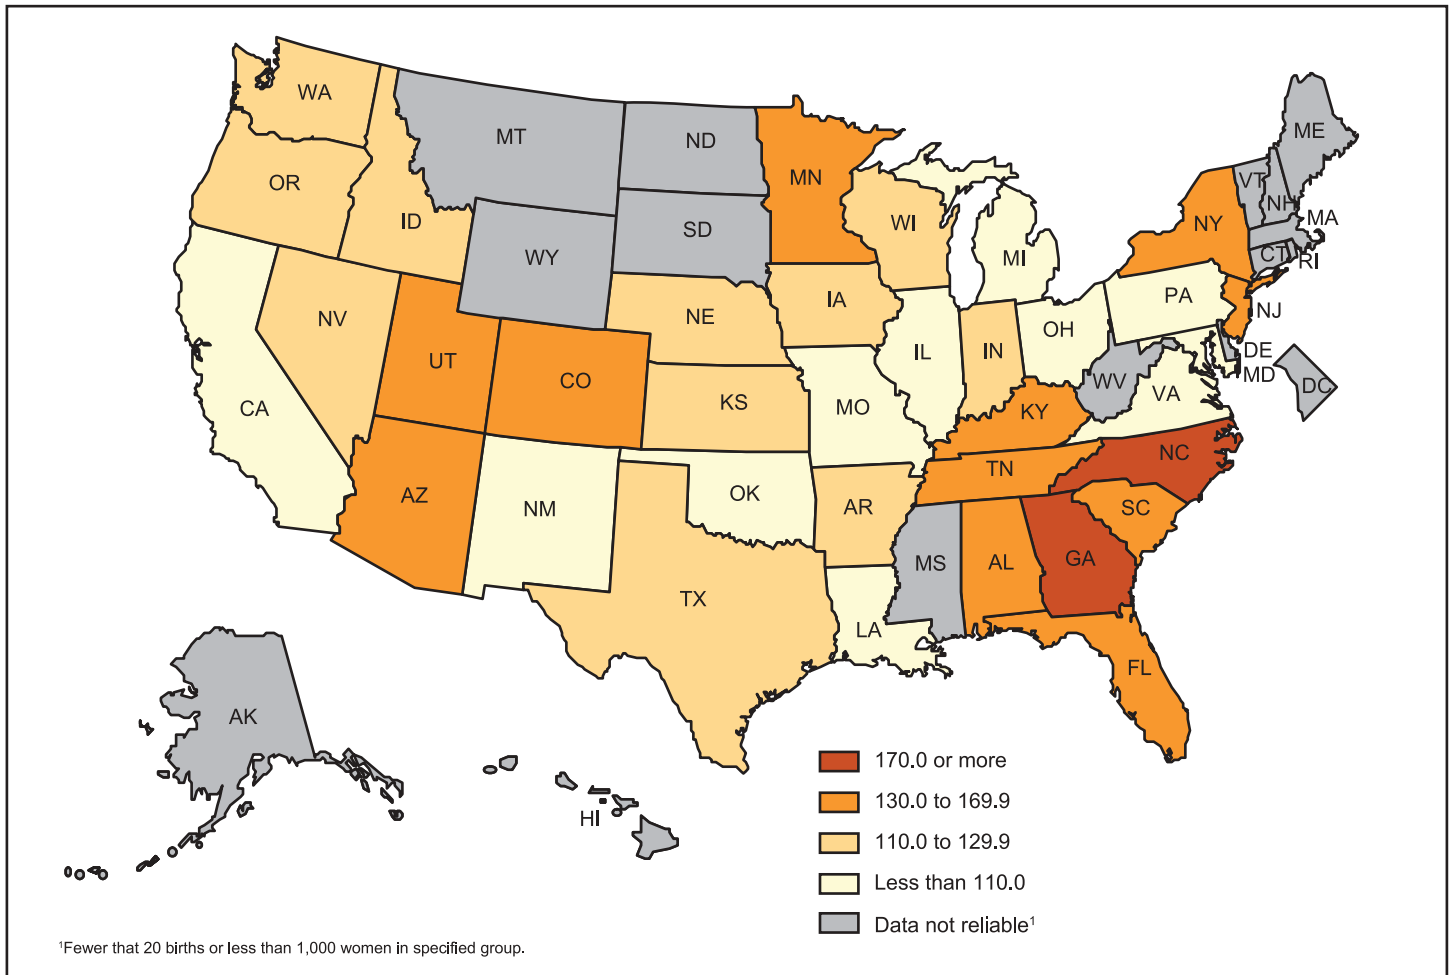

Figure 9. Birth rate for Mexican mothers aged 15–19 years: 2000

Mexican mothers aged 15–19 years had the highest teenage birth rate of any group. Among the 35 States for which statistically reliable rates could be computed, rates ranged from less than

110 per 1,000 (California, Illinois, Louisiana, Maryland, Michigan, Missouri, New Mexico, Ohio, Oklahoma, Pennsylvania, and Virginia) to 190 in North Carolina and Georgia.

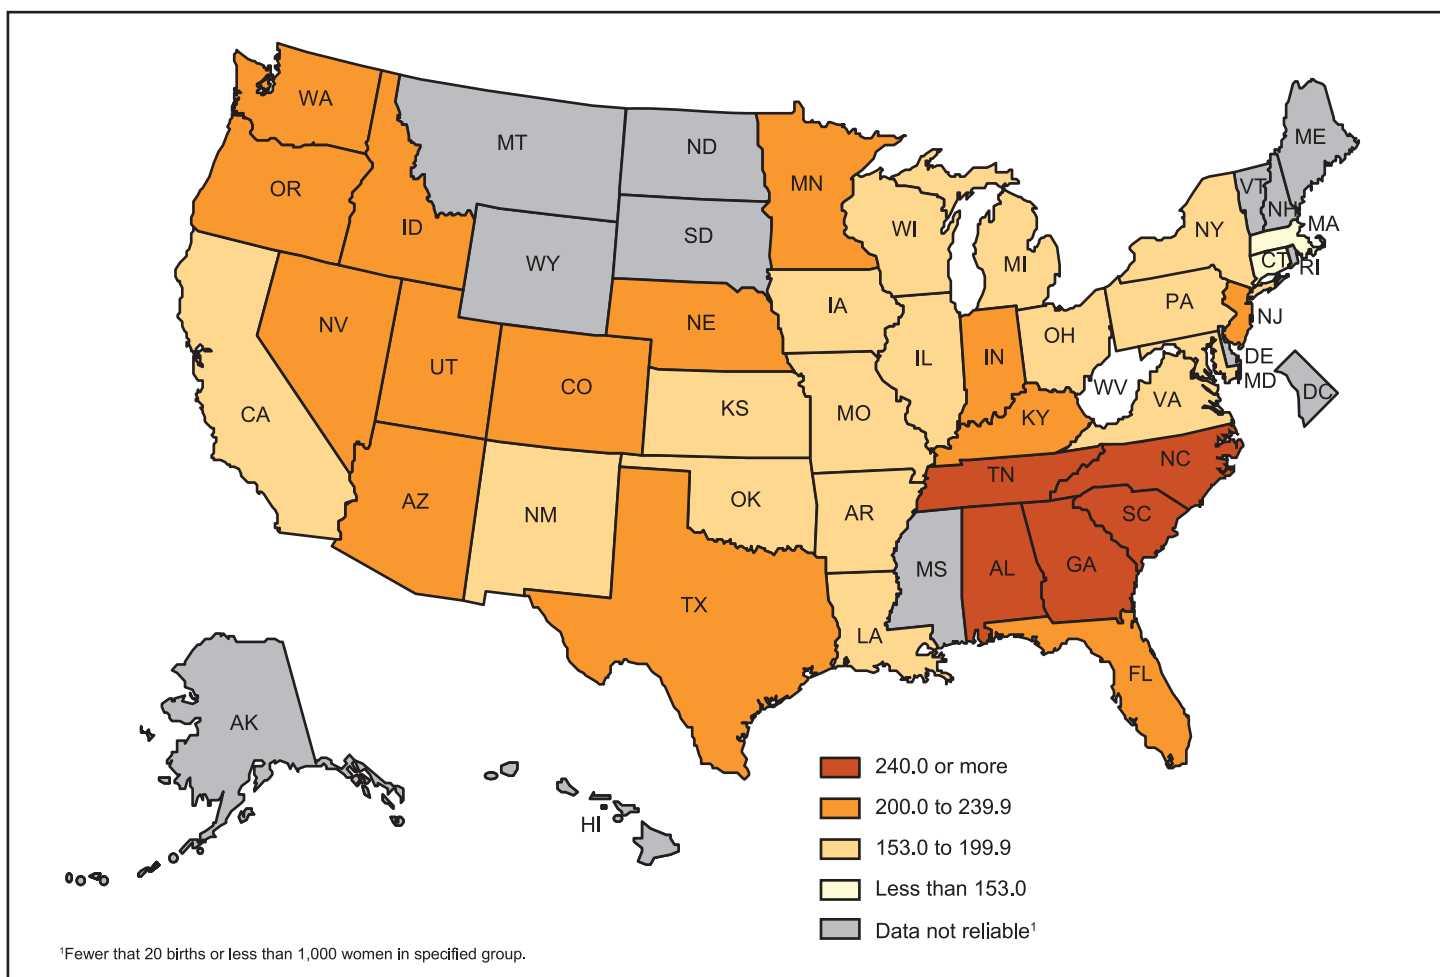

Figure 10. Birth rate for Mexican mothers aged 20–24 years: 2000

Among Mexicans, the birth rate was highest for those aged 20–24 years. Alabama, Georgia, South Carolina, North Carolina, and Tennessee had rates exceeding 240 per 1,000 for Mexicans in this age group.

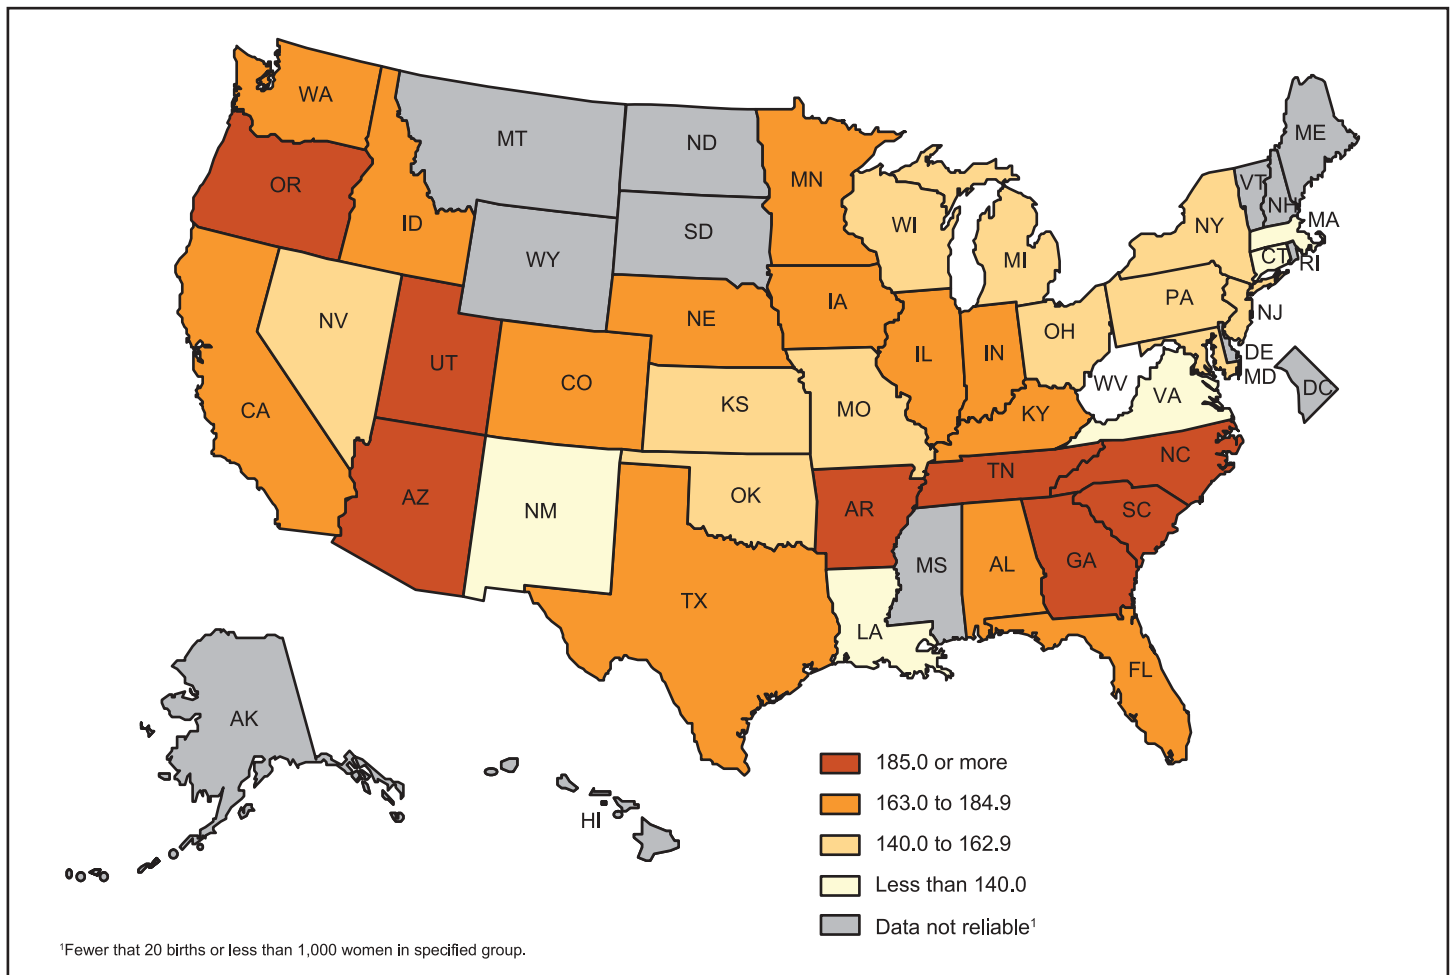

Figure 11. Birth rate for Mexican mothers aged 25–29 years: 2000

High birth rates for Mexican mothers aged 25–29 years are found in both the South (Georgia, South Carolina, North Carolina, Tennessee, and Arkansas) and the West (Arizona, Utah, and Oregon).

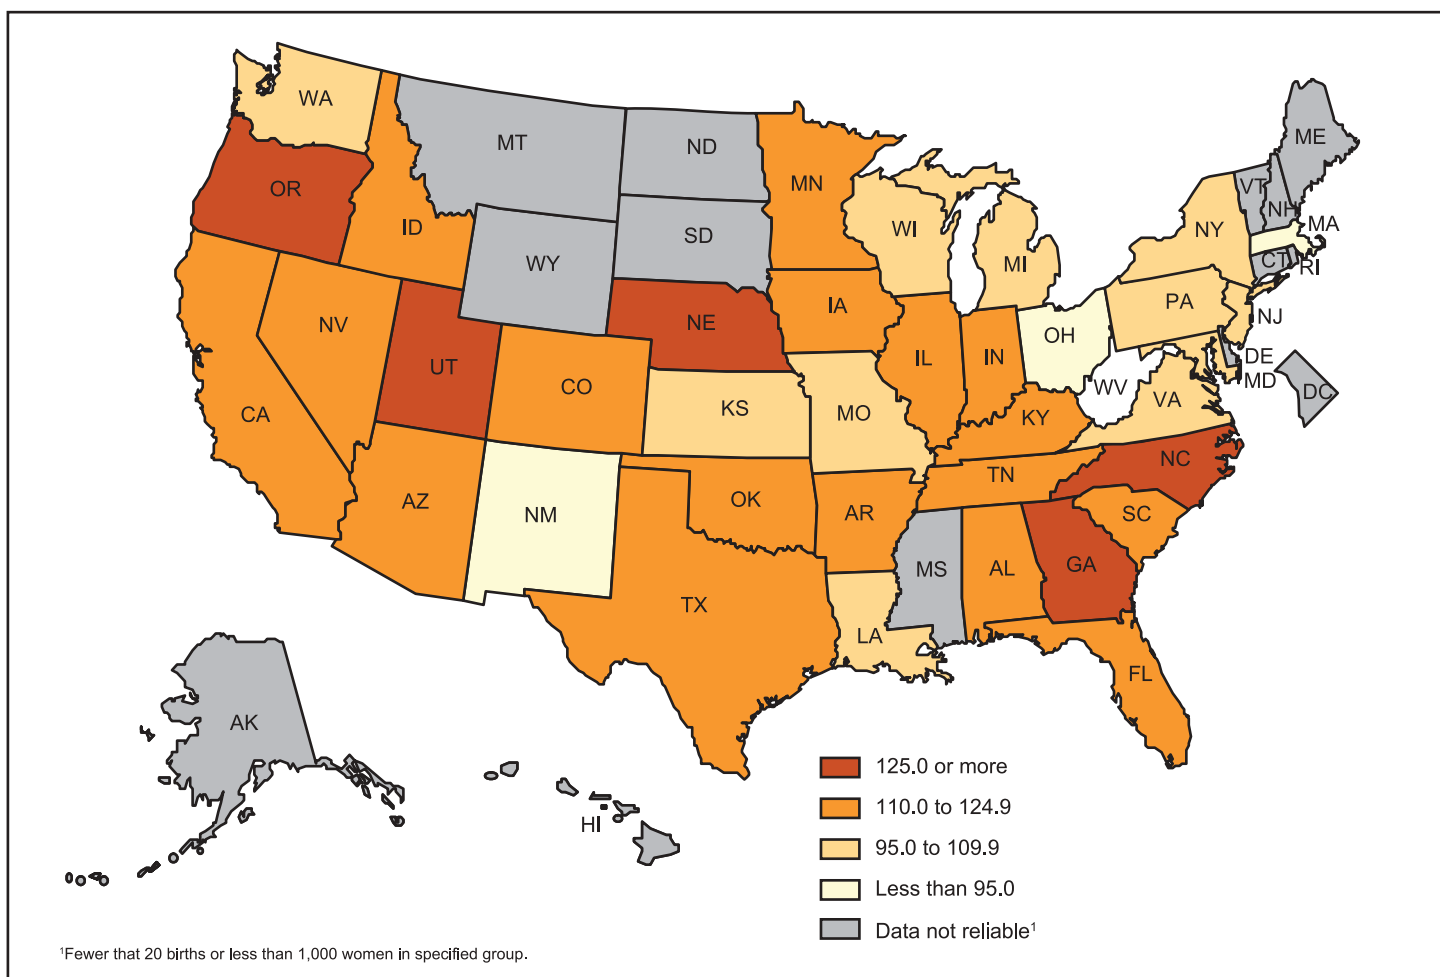

Figure 12. Birth rate for Mexican mothers aged 30-34 years: 2000

North Carolina, Georgia, Nebraska, Utah, and Oregon have the highest birth rates for Mexican mothers aged 30-34 years. New Mexico, Ohio, and Massachusetts had the lowest.

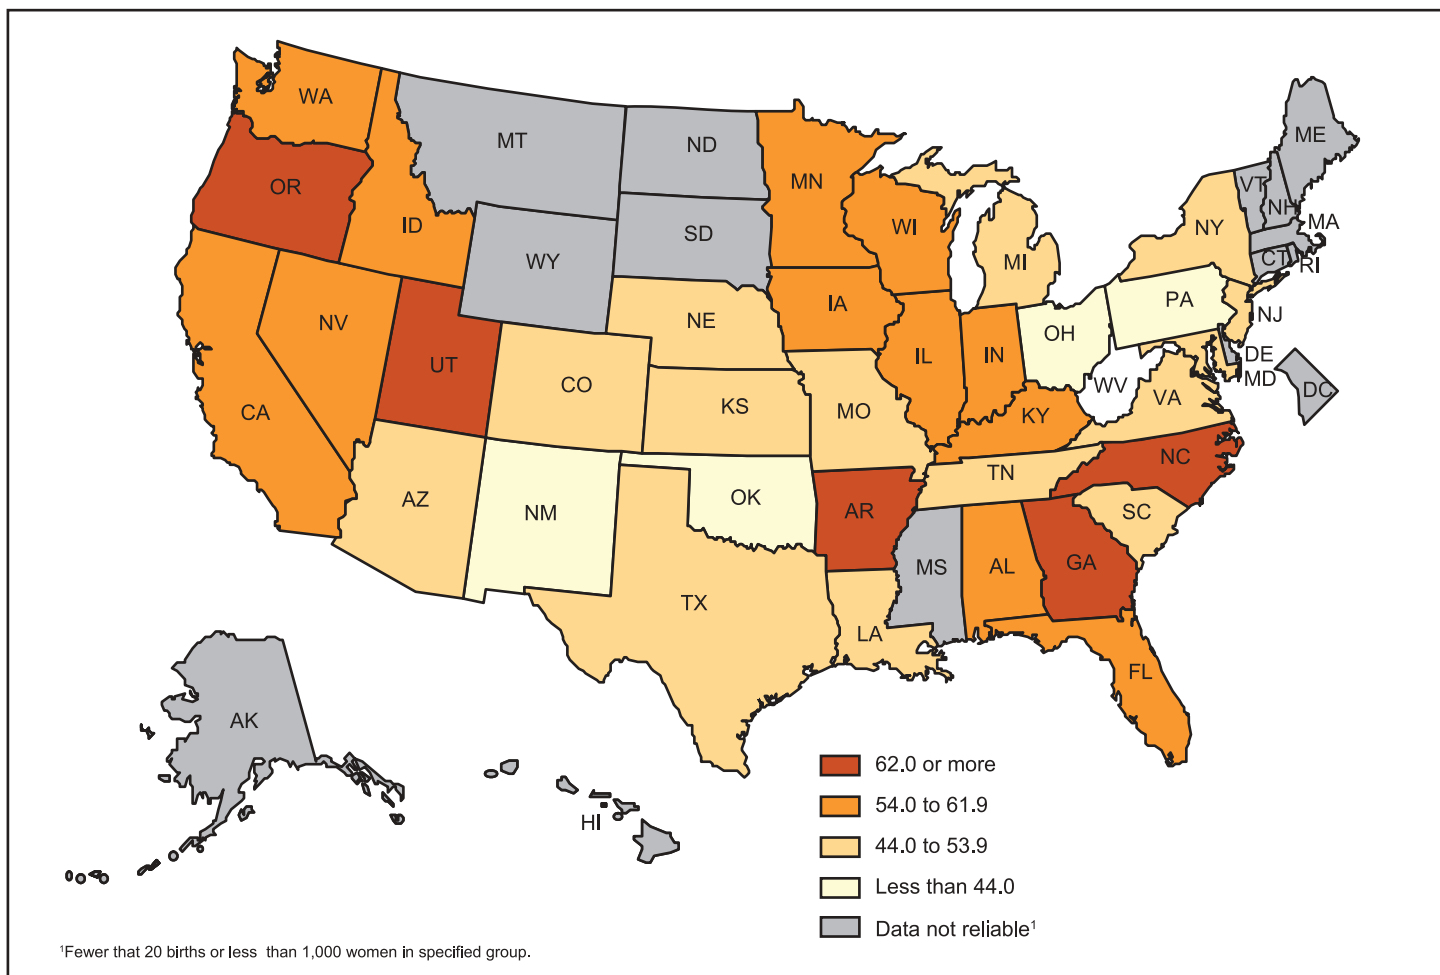

Figure 13. Birth rate for Mexican mothers aged 35–39 years: 2000

Mexican mothers had high birth rates for all age groups in North Carolina and Georgia (see [Figures 9–12](#)), including those aged 35–39 years. Rates for those aged 35–39 years were also high in Arkansas, Utah, and Oregon.

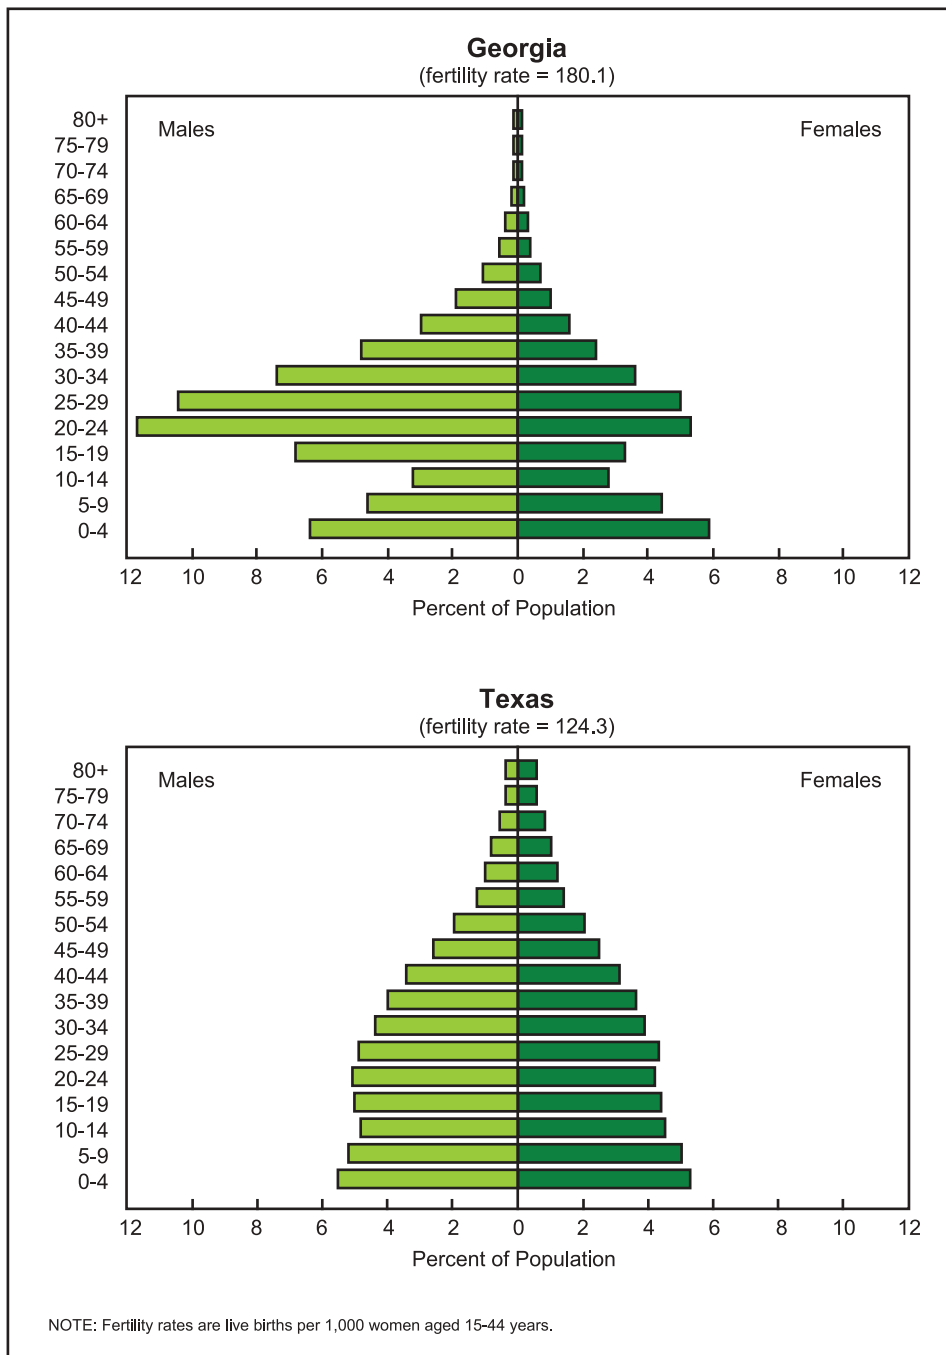

Figure 14. Mexican population by age and sex: Georgia and Texas, 2000

Georgia and Texas represent recent immigrant and well-established Mexican populations, respectively. Recent immigrant populations, like the Mexican population in Georgia, tend to have more men than women. This is particularly true for those in their twenties and thirties, which is when men

are most likely to move for employment opportunities and women are in their peak reproductive years. In contrast, large but well-established Mexican populations, like that in Texas, tend to have lower fertility rates, with the ratio of men to women being more even both overall and by age.

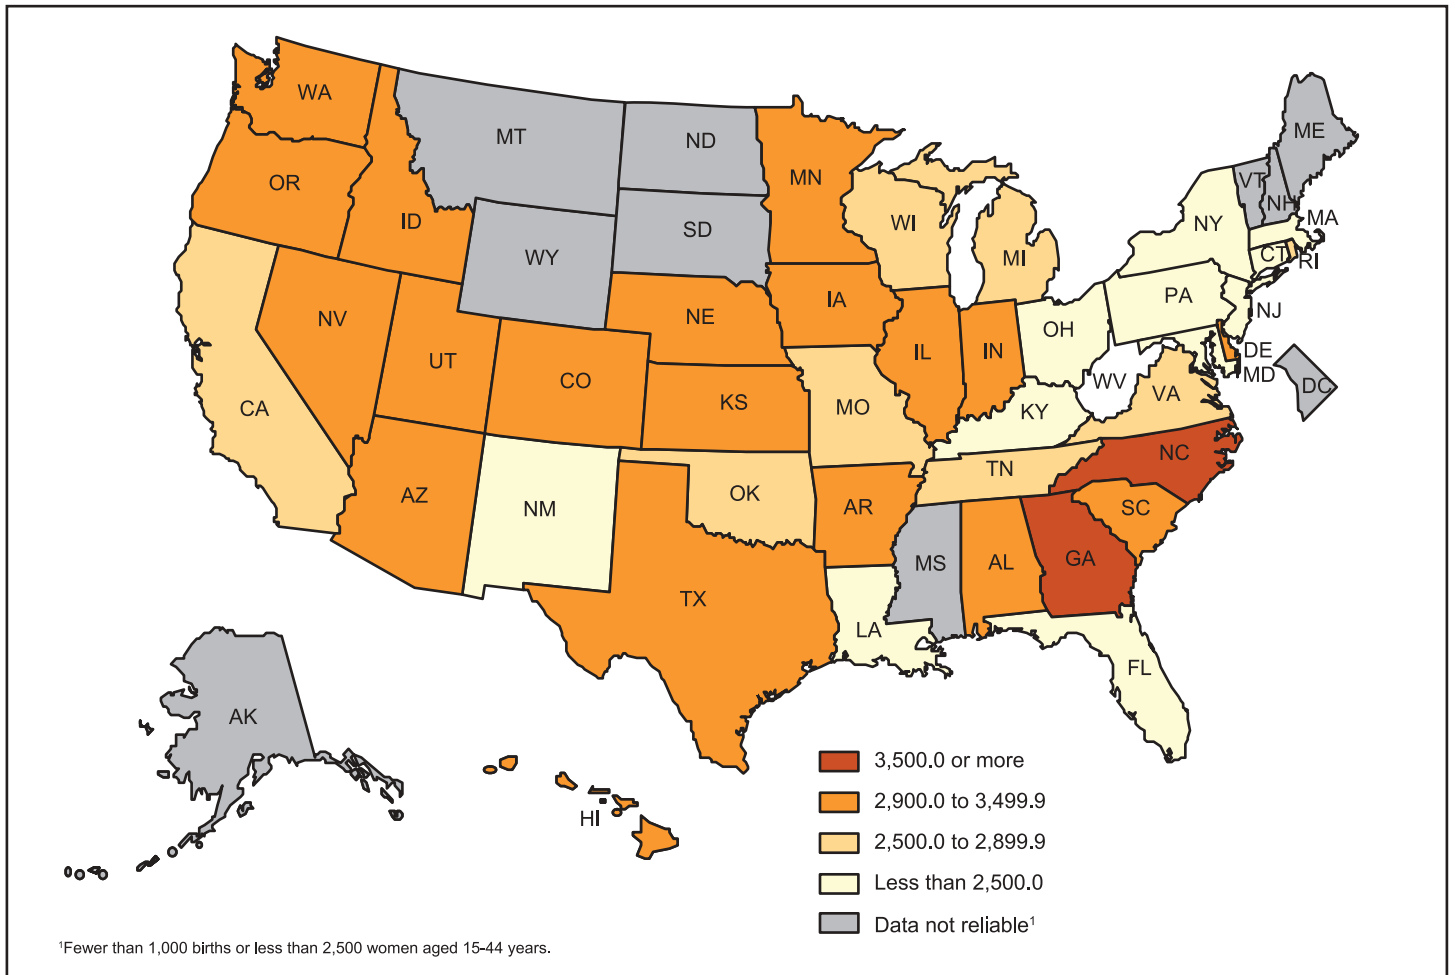

Figure 15. Total fertility rate for mothers of Hispanic origin: 2000

Total fertility rates (TFR) are consistently above replacement level (2,100.0) for Hispanic mothers. The TFR was highest in North Carolina and Georgia.

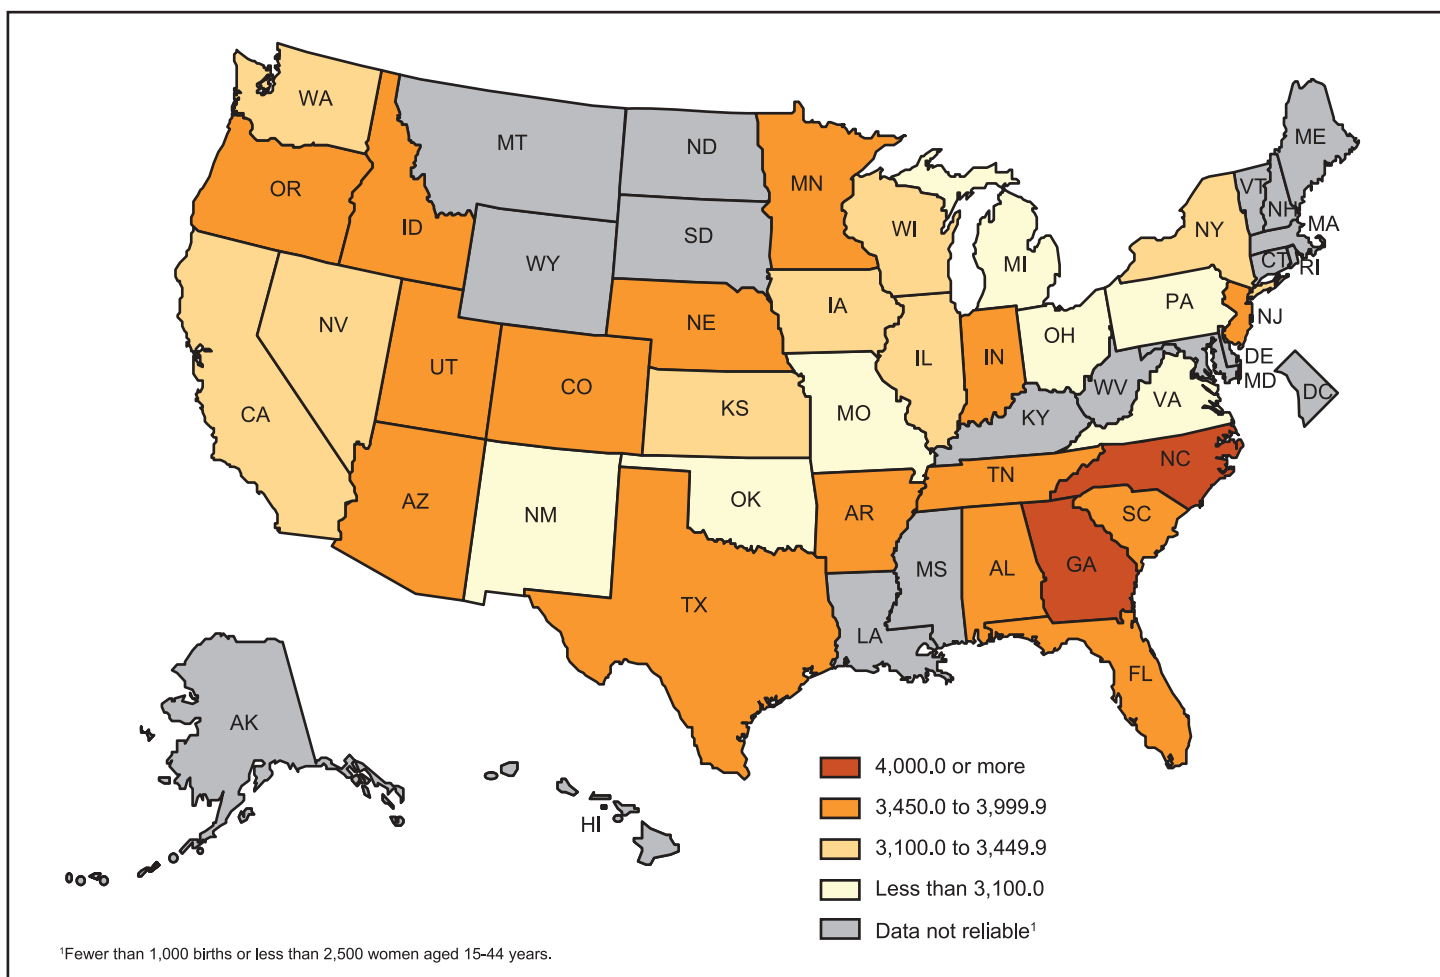

Figure 16. Total fertility rate for Mexican mothers: 2000

Mexican mothers had total fertility rates (TFR) well above replacement level in all States where rates could be calculated. North Carolina and Georgia had TFRs more than double replacement level (4,200.0).

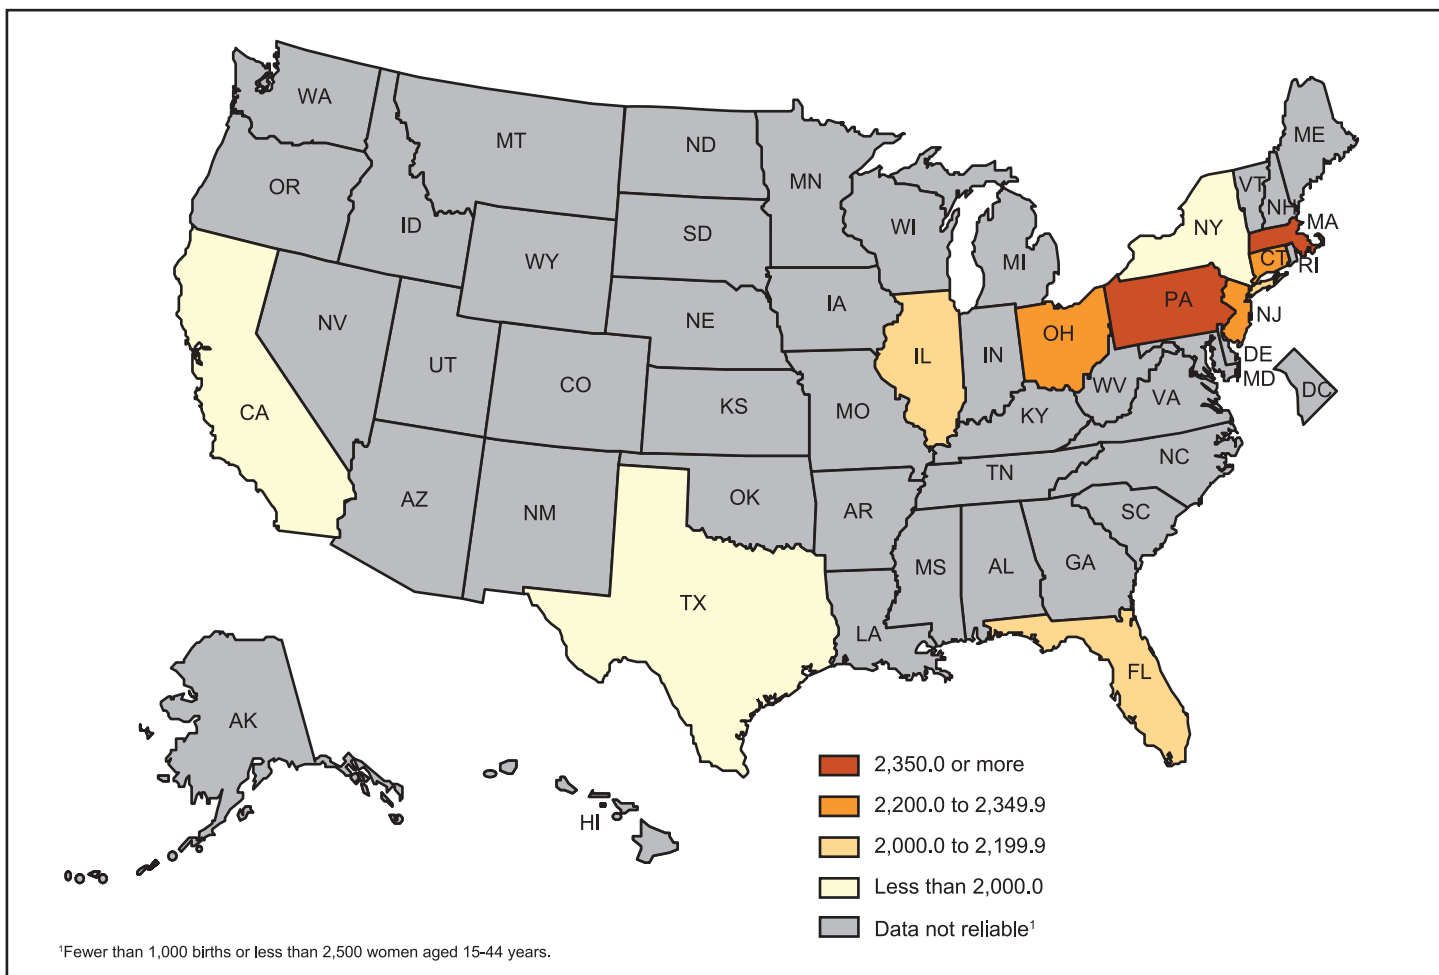

Figure 17. Total fertility rate for Puerto Rican mothers: 2000

Among the 10 States in which total fertility rates for Puerto Ricans could be calculated, 6 had rates above replacement level. Rates were highest in Pennsylvania and Massachusetts (see [Tables 1 and 2](#)).

Table 1. Live births, birth rates, fertility rates, and total fertility rates, by Hispanic origin of mother and by race of mothers of non-Hispanic origin: United States and each State, 1990 and 2000—Con.

[By place of residence. Birth rates are live births per 1,000 population in specified group, enumerated as of April 1; fertility rates are live births per 1,000 women aged 15–44 years in specified group, enumerated as of April 1; total fertility rates are sums of birth rates by 5-year age groups multiplied by 5]

* Figure does not meet standards of reliability or precision; birth and fertility rates based on fewer than 20 births or fewer than 1,000 in specified group; total fertility rate based on fewer than 1,000 births or fewer than 2,500 women aged 15–44 years.

--- Data not available.

¹New Hampshire and Oklahoma did not report Hispanic origin in 1990 and are excluded from the 1990 figures; see "Technical Notes."

²Includes Central and South American and other and unknown Hispanic origin.

³Includes races other than white and black.

⁴Birth and fertility rates include origin not stated.

⁵Live births are births reported in specified group on the birth certificate. Birth rate is births to Mexican and other and unknown Hispanic mothers per 1,000 Mexican and other and unknown Hispanic population; fertility rate is births to Mexican and other and unknown Hispanic mothers per 1,000 Mexican and other and unknown Hispanic women aged 15–44 years; see "Technical Notes."

Table 2. Total fertility rates and age-specific birth rates, by Hispanic origin of mother and by race of mother for mothers of non-Hispanic origin: United States and each State, 1990 and 2000

[By place of residence. Total fertility rates are sums of birth rates by 5-year age groups multiplied by 5; birth rates are live births per 1,000 population in specified group, enumerated as of April 1]

Table 2. Total fertility rates and age-specific birth rates, by Hispanic origin of mother and by race of mother for mothers of non-Hispanic origin: United States and each State, 1990 and 2000—Con.

[By place of residence. Total fertility rates are sums of birth rates by 5-year age groups multiplied by 5; birth rates are live births per 1,000 population in specified group, enumerated as of April 1]

State, Hispanic origin of mother, and race of non-Hispanic mother	Year	Total fertility rate	10–14 years	15–19 years

* Figure does not meet standards of reliability or precision; birth rates based on fewer than 20 births or fewer than 1,000 women in specified group; total fertility rate based on fewer than 1,000 births or fewer than 2,500 women aged 15–44 years.

--- Data not available.

¹Beginning in 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

²New Hampshire and Oklahoma did not report Hispanic origin in 1990 and are excluded from the 1990 figures.

³Includes origin not stated.

⁴Includes Central and South American and other and unknown Hispanic origin.

⁵Includes races other than white and black.

⁶Rates are births to Mexican and "other and unknown Hispanic" mothers per 1,000 Mexican and "other and unknown Hispanic" women in specified group; see "Technical Notes."

Table 3. First birth rates by age, by Hispanic origin of mother, and by race of mother for mothers of non-Hispanic origin: United States and each State, 1990 and 2000

* Figure does not meet standards of reliability or precision; rates based on fewer than 20 births or fewer than 1,000 women in specified group.

- - - Data not available.

¹Beginning in 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

²New Hampshire and Oklahoma did not report Hispanic origin in 1990 and are excluded from the 1990 figures.

³Includes origin not stated.

⁴Includes Central and South American and other and unknown Hispanic origin.

⁵Includes races other than white and black.

⁶Rates are first births to Mexican and other and unknown Hispanic mothers per 1,000 Mexican and other and unknown Hispanic women in specified group; see "Technical Notes."

¹Includes Central American, South American, and other Hispanic.

²Includes races other than white and black.

³National populations for Hispanic subgroups (Mexican, Puerto Rican, Cuban, and other Hispanic) are consistent with the March 2001 Current Population Survey and will not equal the sum of the State specific populations; see "Technical Notes."

SOURCES: National Center for Health Statistics. Bridged April 1, 2000, population counts for the four race groups (White, Black or African American, American Indian or Alaska Native, and Asian or Pacific Islander) by county, single year of age, sex, and Hispanic origin. File br040100.txt (ASCII). Released January 12, 2003. Available from <http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>; U.S. Census Bureau. Census 2000 Summary File 2—United States. Washington: U.S. Census Bureau. 2001; and U.S. Census Bureau. 1990 Populations prepared for the National Center for Health Statistics by age, sex, race, and Hispanic origin subgroup. Washington: U.S. Census Bureau. July 20, 1992.

¹National populations for Hispanic subgroups (Mexican, Puerto Rican, Cuban, and Other Hispanic) are consistent with the March 2001 Current Population Survey and will not equal the sum of the State specific populations; see "Technical Notes."

²Includes Central American, South American, and other Hispanic.

³Includes races other than white and black.

SOURCES: National Center for Health Statistics. Bridged April 1, 2000, population counts for the four race groups (White, Black or African American, American Indian or Alaska Native, and Asian or Pacific Islander) by county, single year of age, sex, and Hispanic origin. File br040100.txt (ASCII). Released January 12, 2003. Available from <http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>; U.S. Census Bureau. Census 2000 Summary File 2—United States. Washington: U.S. Census Bureau. 2001; and U.S. Census Bureau. 1990 Populations prepared for the National Center for Health Statistics by age, sex, race, and Hispanic origin subgroup. Washington: U.S. Census Bureau. July 20, 1992.

Appendix

Technical Notes

Sources of data

Data presented in this report are based on information reported on birth certificates filed for all births in the United States. Data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). Details on the data elements collected in the birth certificate file are discussed in previous reports (1).

Age of mother

Age of mother is computed in most cases from the mother's and infant's dates of birth as reported on the birth certificate. The mother's age is directly reported by five States (Kentucky, Nevada, North Dakota, Virginia, and Wyoming). From 1964 to 1996, births reported to occur to mothers younger than age 10 or older than age 49 years had age imputed according to the age of mother from the previous record with the same race and total birth order (total of live births and fetal deaths). Beginning in 1997, age of mother is imputed for those aged 9 years or under and those aged 55 years and over. A review and verification of unedited birth data for 1996 showed that the vast majority of births reported as occurring to women aged 50 years and over were to women aged 50–54 years. The numbers of births to women aged 50–54 years are too small for computing age-specific birth rates. These births have been included with births to women aged 45–49 years for computing birth rates.

When age of mother was not reported, it was imputed according to the last record with the same race and total birth order. In 2000, this was necessary on 0.02 percent of records.

Race and Hispanic origin

Hispanic origin

Hispanic origin and race are reported separately on the birth

certificate. In tabulations of birth data by race and Hispanic origin, data for persons of Hispanic origin are not further classified by race because the vast majority of births to Hispanic women are reported as white.

Birth data for specified Hispanic groups are reported for five groups: Mexican, Puerto Rican, Cuban, Central and South American, and other and unknown Hispanic. For the purpose of this report, neither Central and South American nor other and unknown Hispanic constitute a meaningful analytic category. Thus, in this report Central and South Americans are collapsed into the category "other and unknown Hispanic." Data presented in this report for other and unknown Hispanics should be interpreted cautiously. Also see section on the computation of rates.

Items asking for the Hispanic origin of the mother have been included on the birth certificates of all States and the District of Columbia since 1993 (13). New Hampshire and Oklahoma did not report Hispanic origin in 1990. In 1990 and 2000, approximately 1 percent of records did not include information on mother's origin. See annual "Technical Appendix" for the percentage of records in which Hispanic origin of mother was not reported by State in 1990 and 2000 (14,15).

Birth and fertility rates shown for the Mexican population in New Mexico are based on births to Mexican and "other" Hispanic women combined and on combined Mexican and "other" Hispanic population. It was necessary to compute a combined rate because it appears that these two groups were not reported consistently on the birth certificate and in the census.

Single, multiple, and bridged race of mother and father

In 1997, the Office of Management and Budget (OMB) issued "Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity," which revised the "1977 Statistical Policy Directive 15, Race and Ethnic Standards for Federal Statistics and Administrative Reporting" (10,11,16). These documents specify guidelines for

collection, tabulation, and presentation of race and ethnicity data within the Federal statistical system. The 1997 revised standards incorporated two major changes designed to reflect the changing race and ethnic profile of the United States. First, the revision increased from four to five the minimum set of categories to be used by Federal agencies for identification of race. The 1977 standards required Federal agencies to report race-specific tabulations using a minimum set of four single-race categories: American Indian or Alaska Native (AIAN), Asian or Pacific Islander (API), black, and white. The five categories for race specified in the 1997 standards are as follows: AIAN, Asian, Black or African American, Native Hawaiian or Other Pacific Islander, and White. The revised standards called for reporting Asians separately from Native Hawaiians or Other Pacific Islanders. Collection of additional detail on race and ethnicity is permitted, as before so long as the additional categories can be aggregated into the minimum categories. The revised standards also require Federal data collection programs to allow respondents to select one or more race categories.

For the 2000 decennial census, the U.S. Census Bureau collected race and ethnicity data in accordance with the 1997 revised standards. However, the National Vital Statistics System, which is based on data collected by the States, will not be fully compliant with the new standards until all of the States revise their birth certificates to reflect the new standards. Thus, beginning with the 2000 data year, the numerators (births) for birth rates are incompatible with the denominators (populations) (see "Population denominators"). In order to compute rates, it is necessary to bridge population data for multiple-race persons to single-race categories. This has been done for birth rates by race presented in this report.

Race of mother is not reported for all births (0.5 percent in 2000). In these cases, if the race of the father was known, the race of the father was assigned to the mother. When information was not available for either parent, the race of the mother was

imputed according to the specific race of the mother on the preceding record with a known race of mother. This was necessary for 0.3 and 0.4 percent of births in 1990 and 2000, respectively.

Population denominators

Birth and fertility rates by State for 1990 shown in [Tables 1–3](#) are based on the 1990 census. Rates by State for 2000 also shown in [Tables 1–3](#) are based on populations estimated using data from the 2000 census. These populations are shown in [Tables 4](#) and [5](#). The population estimates for 2000 have been provided by the U.S. Census Bureau (4) and are consistent with the 2000 census counts by age, race, and sex, which have been modified to be consistent with OMB race categories as of 1977 and historical categories for birth data. The modification procedures are described in detail elsewhere (11,12,17). Additionally, national population estimates for 2000 for Hispanic subgroups (Mexican, Puerto Rican, Cuban, and other and unknown Hispanic) were adjusted to be consistent with the 2001 Current Population Survey and previously published birth and fertility rates (9). As a result, national populations for Hispanic subgroups presented in [Tables 4](#) and [5](#) do not equal the sum of the State specific populations. Rates by State shown in this report may differ from rates computed on the basis of other population estimates.

In order to produce birth and fertility rates for 2000, it was necessary to “bridge” the reported population data for multiple-race persons back to single-race categories. In addition, the 2000 census counts were modified to be consistent with the 1977 OMB race categories; that is, to report the data for Asian persons and Native Hawaiians or other Pacific Islanders as a combined category Asian or Pacific Islanders (17,18). The procedures used to produce the “bridged” populations are described in separate publications (11,17).

Readers should keep in mind that the population data used to compile birth and fertility rates by race and ethnicity for 2000 shown in this report are based on special estimation

procedures and are not actual counts. This is the case even though the 2000 populations are based on the 2000 census. As a result, the estimation procedures used to develop these populations may contain some errors. Smaller populations are likely to be affected much more than larger populations by potential measurement error (11). Although the nature and magnitude of error is unknown, the potential for error should be kept in mind when evaluating trends and differentials. As more accurate information becomes available, further revisions of the estimates may be necessary.

Computation of rates

In computing birth and fertility rates for the Hispanic population, births with origin of mother not stated are included with non-Hispanic births rather than being distributed. Thus, rates for the U.S. Hispanic population are underestimates of the true rates to the extent that the births with origin of mother not stated (1.1 percent in 2000) were actually to Hispanic mothers. In computing the rates, the census-based populations with origin not stated are imputed. The effect on the rates is believed to be small.

Rates for other and unknown Hispanic are computed by dividing births to mothers of other and unknown Hispanic origin (numerator) by the population of other Hispanic origin (denominator), which includes the population of Hispanic origin not separately identified (Mexicans, Puerto Ricans, and Cubans). Thus, rates for other and unknown Hispanic origin should be interpreted cautiously.

An asterisk (*) is shown in place of any derived rate based on fewer than 20 births in the numerator, or a population denominator of less than 1,000. Rates based on births or populations below these minimum levels lack sufficient reliability for analytic purposes. In addition, total fertility rates are only computed for subgroups that had at least 1,000 total births in the numerator and 2,500 women aged 15–44 years in the denominator.

Random variation and significance testing for natality data

The number of births reported for an area is essentially a complete count because more than 99 percent of all births are registered. Although this number is not subject to sampling error, it may be affected by nonsampling errors in the registration process such as mistakes in recording the mother’s residence or age during the registration process.

When the number of births is used for analytic purposes (that is, the comparison of numbers, and rates over time, for different areas, or between different groups), the number of events that *actually* occurred can be thought of as one outcome in a large series of possible results that *could have* occurred under the same (or similar) circumstances. When considered in this way, the number of births is subject to random variation and a probable range of values estimated from the actual figures, according to certain statistical assumptions.

The confidence interval is the range of values for the number of births or birth rates that you could expect in 95 out of 100 cases. The confidence limits are the end points of this range of values (the highest and lowest values). Confidence limits tell how much the number of events or rates could vary under the same (or similar) circumstances.

Confidence limits for numbers, rates, and percentages can be estimated from the actual number of vital events. Procedures differ for rates and percentages and also differ depending on the number of births on which these statistics are based. Following are detailed procedures and examples for each type of case.

When the number of vital events is large, the distribution is assumed to follow a normal distribution (where the relative standard error is small). When the number of events is small and the probability of the event is small, the distribution is assumed to follow a Poisson probability distribution. Considerable caution should be observed

in interpreting the occurrence of infrequent events.

95 percent confidence limits for numbers less than 100

When the number of births is less than 100 and the rate is small, the data are assumed to follow a Poisson probability distribution (19). Confidence limits are estimated using the following formulas:

$$\text{Lower limit} = B \cdot L$$

$$\text{Upper limit} = B \cdot U$$

where:

B = number of births

L = the value in [Table I](#) that corresponds to the number B

U = the value in [Table I](#) that corresponds to the number B

Example

Suppose that the number of first births to Puerto Rican women aged 40–44 years was 47. The confidence limits for this number would be:

$$\begin{aligned} \text{Lower limit} &= 47 \cdot 0.73476 \\ &= 35 \end{aligned}$$

$$\begin{aligned} \text{Upper limit} &= 47 \cdot 1.32979 \\ &= 63 \end{aligned}$$

This means that the chances are 95 out of 100 that the actual number of first births to Puerto Rican women aged 40–44 years would lie between 35 and 63.

95 percent confidence limits for numbers of 100 or more

When the number of events is greater than 100, the data are assumed to approximate a normal distribution. Formulas for 95 percent confidence limits are:

$$\text{Lower limit} = B - (1.96 \cdot \sqrt{B})$$

$$\text{Upper limit} = B + (1.96 \cdot \sqrt{B})$$

where:

B = number of births

Example

Suppose that the number of first births to non-Hispanic white women aged 40–44 years was 14,108. The 95 percent confidence limits for this number would be:

$$\begin{aligned} \text{Lower limit} &= 14,108 - (1.96 \cdot \sqrt{14,108}) \\ &= 14,108 - 233 \\ &= 13,875 \end{aligned}$$

$$\begin{aligned} \text{Upper limit} &= 14,108 + (1.96 \cdot \sqrt{14,108}) \\ &= 14,108 + 233 \\ &= 14,341 \end{aligned}$$

This means that the chances are 95 out of 100 that the actual number of first births to Puerto Rican women aged 40–44 years would lie between 35 and 63.

Computing confidence intervals for rates

The same statistical assumptions can be used to estimate the variability in birth rates. Again, one formula is used for rates based on numbers of events less than 100 and another formula for rates based on numbers of 100 or greater. For our purposes, assume that the denominators of these rates (the population estimates) have no error. Although this assumption is technically correct *only* for denominators based on the census that occurs every 10 years, the error in intercensal population estimates is usually small, difficult to measure, and, therefore, not considered. (See, however, discussion of population denominators earlier in the “Technical Notes.”)

95 percent confidence limits for rates based on fewer than 100 events

When the number of events in the numerator is less than 20 or the population in the denominator is less than 1,000, an asterisk (*) is shown in place of the rate because there were too few births or the population is too small to compute a statistically reliable rate. When the number of events in the numerator is greater than 20 but less than 100, the confidence interval for a

rate can be estimated using the two formulas that follow and the values in [Table I](#).

$$\text{Lower limit} = R \cdot L$$

$$\text{Upper limit} = R \cdot U$$

where:

R = birth rate

L = the value in [Table I](#) that corresponds to the number B

U = the value in [Table I](#) that corresponds to the number B

Example

Suppose that the first birth rate for Puerto Rican women aged 40–44 years was 0.50 per thousand, based on 47 births in the numerator. Using [Table I](#):

$$\begin{aligned} \text{Lower limit} &= 0.50 \cdot 0.73476 \\ &= 0.37 \end{aligned}$$

$$\begin{aligned} \text{Upper limit} &= 0.50 \cdot 1.32979 \\ &= 0.66 \end{aligned}$$

This means that the chances are 95 out of 100 that the actual first birth for Puerto Rican women aged 40–44 years lies between 0.37 and 0.66.

95 percent confidence limits for rates when numerator is 100 or more

In this case, use the following formula for the birth rate R based on the number of births B :

$$\text{Lower limit} = R - (1.96 \cdot (R / \sqrt{B}))$$

$$\text{Upper limit} = R + (1.96 \cdot (R / \sqrt{B}))$$

where:

R = birth rate

B = number of births

Example

Suppose that the first birth rate for non-Hispanic white women aged 40–44 years was 1.55 per thousand, based on 14,108 births in the numerator. Therefore, the 95 percent confidence interval would be:

Table I. Values of *L* and *U* for calculating 95 percent confidence limits for numbers of events and rates when the number of events is less than 100

44	0.72660	1.34245	94	0.80810	1.22375
45	0.72941	1.33808	95	0.80906	1.22245
46	0.73213	1.33386	96	0.81000	1.22117
47	0.73476	1.32979	97	0.81093	1.21992
48	0.73732	1.32585	98	0.81185	1.21868
49	0.73981	1.32205	99	0.81275	1.21746
50	0.74222	1.31838			

Lower limit = $1.55 - (1.96 \cdot (1.55 / \sqrt{14,108}))$
 = $1.55 - 0.026$
 = 1.52

Upper limit = $1.55 + (1.96 \cdot (1.55 / \sqrt{14,108}))$
 = $1.55 + 0.026$
 = 1.58

This means that the chances are 95 out

of 100 that the actual first birth rate for non-Hispanic white women aged 40–44 years lies between 1.52 and 1.58.

Significance Testing

One or both of the rates is based on fewer than 100 cases

To compare two rates when one or both of those rates are based on less

than 100 cases, you first compute the confidence intervals for both rates. Then check to see whether those intervals overlap. If they **do** overlap, the difference is not statistically significant at the 95 percent level. If they **do not** overlap, the difference is indeed statistically significant.

Example

Suppose that the first birth rate for Cuban women aged 40–44 years was 0.70 per 1,000 in year X and 0.57 in year Y. Is the rate for year X significantly higher than the rate for year Y? The two rates are based on 63 events in year X and 54 events in year Y. Both rates are based on fewer than 100 events; therefore, the first step is to compute the confidence intervals for both rates.

	Lower limit	Upper limit
Year X	0.54	0.90
Year Y	0.43	0.74

These two confidence intervals overlap. Therefore, the first birth rate for Cuban women aged 40–44 years in year X is not significantly higher (at the 95 percent confidence level) than the rate in year Y.

This method of comparing confidence intervals is a conservative test for statistical significance. That is, the difference between two rates may, in fact, be statistically significant even though confidence intervals for the two rates overlap (20). Thus, caution should be observed when interpreting a nonsignificant difference between two rates, especially when the lower and upper limits being compared overlap only slightly.

Both rates are based on 100 or more events

When both rates are based on 100 or more events, the difference between the two rates, irrespective of sign (+/-), is considered statistically significant if it exceeds the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two rates.

$$1.96 \cdot \sqrt{\frac{R_1^2}{N_1} + \frac{R_2^2}{N_2}}$$

where:

- R_1 = first rate
- R_2 = second rate
- N_1 = first number of births
- N_2 = second number of births

If the difference is **greater** than this statistic, then the difference would occur by chance fewer than five times out of 100. If the difference is **less than or equal** to this statistic, the difference might occur by chance more than 5 times out of 100. We say that the difference is not statistically significant at the 95 percent confidence level.

Example

Is the first birth rate for non-Hispanic black women aged 40–44 years (1.08 per 1,000) significantly lower than the comparable rate for non-Hispanic white women (1.55)? Both rates are based on more than 100 births (1,535 for non-Hispanic black women and 14,108 for non-Hispanic white women). The difference between the rates is $1.55 - 1.08 = 0.47$. The statistic is then calculated as follows:

$$\begin{aligned}
 &1.96 \cdot \sqrt{\frac{1.08^2}{1,535} + \frac{1.55^2}{14,108}} \\
 &= 1.96 \times \\
 &\sqrt{([1.166/1,535] + [2.403/14,108])} \\
 &= 1.96 \cdot \sqrt{0.00076 + 0.00017} \\
 &= 1.96 \cdot \sqrt{0.00093} \\
 &= 1.96 \cdot 0.03 \\
 &= 0.06
 \end{aligned}$$

The difference between the rates (0.47) is greater than this statistic (0.06). Therefore, the difference is statistically significant at the 95 percent confidence level.

Vital and Health Statistics series descriptions

- SERIES 1. **Programs and Collection Procedures**—These reports describe the data collection programs of the National Center for Health Statistics. They include descriptions of the methods used to collect and process the data, definitions, and other material necessary for understanding the data.
- SERIES 2. **Data Evaluation and Methods Research**—These reports are studies of new statistical methods and include analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory. These studies also include experimental tests of new survey methods and comparisons of U.S. methodology with those of other countries.
- SERIES 3. **Analytical and Epidemiological Studies**—These reports present analytical or interpretive studies based on vital and health statistics. These reports carry the analyses further than the expository types of reports in the other series.
- SERIES 4. **Documents and Committee Reports**—These are final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
- SERIES 5. **International Vital and Health Statistics Reports**—These reports are analytical or descriptive reports that compare U.S. vital and health statistics with those of other countries or present other international data of relevance to the health statistics system of the United States.
- SERIES 6. **Cognition and Survey Measurement**—These reports are from the National Laboratory for Collaborative Research in Cognition and Survey Measurement. They use methods of cognitive science to design, evaluate, and test survey instruments.
- SERIES 10. **Data From the National Health Interview Survey**—These reports contain statistics on illness; unintentional injuries; disability; use of hospital, medical, and other health services; and a wide range of special current health topics covering many aspects of health behaviors, health status, and health care utilization. They are based on data collected in a continuing national household interview survey.
- SERIES 11. **Data From the National Health Examination Survey, the National Health and Nutrition Examination Surveys, and the Hispanic Health and Nutrition Examination Survey**—Data from direct examination, testing, and measurement on representative samples of the civilian noninstitutionalized population provide the basis for (1) medically defined total prevalence of specific diseases or conditions in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics, and (2) analyses of trends and relationships among various measurements and between survey periods.
- SERIES 12. **Data From the Institutionalized Population Surveys**—Discontinued in 1975. Reports from these surveys are included in Series 13.
- SERIES 13. **Data From the National Health Care Survey**—These reports contain statistics on health resources and the public's use of health care resources including ambulatory, hospital, and long-term care services based on data collected directly from health care providers and provider records.
- SERIES 14. **Data on Health Resources: Manpower and Facilities**—Discontinued in 1990. Reports on the numbers, geographic distribution, and characteristics of health resources are now included in Series 13.
- SERIES 15. **Data From Special Surveys**—These reports contain statistics on health and health-related topics collected in special surveys that are not part of the continuing data systems of the National Center for Health Statistics.
- SERIES 16. **Compilations of Advance Data From Vital and Health Statistics**—Advance Data Reports provide early release of information from the National Center for Health Statistics' health and demographic surveys. They are compiled in the order in which they are published. Some of these releases may be followed by detailed reports in Series 10–13.
- SERIES 20. **Data on Mortality**—These reports contain statistics on mortality that are not included in regular, annual, or monthly reports. Special analyses by cause of death, age, other demographic variables, and geographic and trend analyses are included.
- SERIES 21. **Data on Natality, Marriage, and Divorce**—These reports contain statistics on natality, marriage, and divorce that are not included in regular, annual, or monthly reports. Special analyses by health and demographic variables and geographic and trend analyses are included.
- SERIES 22. **Data From the National Mortality and Natality Surveys**—Discontinued in 1975. Reports from these sample surveys, based on vital records, are now published in Series 20 or 21.
- SERIES 23. **Data From the National Survey of Family Growth**—These reports contain statistics on factors that affect birth rates, including contraception, infertility, cohabitation, marriage, divorce, and remarriage; adoption; use of medical care for family planning and infertility; and related maternal and infant health topics. These statistics are based on national surveys of women of childbearing age.
- SERIES 24. **Compilations of Data on Natality, Mortality, Marriage, and Divorce**—These include advance reports of births, deaths, marriages, and divorces based on final data from the National Vital Statistics System that were published as *National Vital Statistics Reports* (NVSR), formerly *Monthly Vital Statistics Report*. These reports provide highlights and summaries of detailed data subsequently published in *Vital Statistics of the United States*. Other special reports published here provide selected findings based on final data from the National Vital Statistics System and may be followed by detailed reports in Series 20 or 21.
